TMC4330A DATASHEET

TMC4330A Document Revision 1.00 • 2016-NOV-25

The S-ramp and sixPoint[™] ramp motion controller for stepper motors is optimized for high velocities, allowing on-the-fly changes. TMC4330A offers Step/Dir interfaces, as well as an encoder interface for closed-loop operation.

Figure 1: Sample Image TMC4330A Closed-Loop Drive *Marking details are explained on page <u>159</u>. **Features**

- SPI Interfaces for µC with easy-to-use protocol.
- Encoder interface for incremental or serial encoders.
- Closed-loop operation for Step drivers.
- Internal ramp generator generating S-shaped ramps or sixPoint[™] ramps supporting on-the-fly changes.
- Controlled PWM output.
- Reference switch handling.
- Hardware and virtual stop switches.

Applications

Textile, sewing machines •

Printers, scanners

ATM, cash recycler

CCTV, security •

.

- Office automation POS
- Factory automation •
- Lab automation
- Pumps and valves
- Heliostat controllers
- **CNC** machines
- Robotics

Read entire documentation; especially the Supplemental Directives in chapter 17 (page 160).

Functional Scope of TMC4330A

TMC4330A is a miniaturized high-performance motion controller for stepper motor drivers, particularly designed for fast and jerk-limited motion profile applications with a wide range of ramp profiles. The S-shaped or sixPoint[™] velocity profile, closed-loop and open-loop features offer many configuration options to suit the user's specifications, as presented below:

S-Shaped Velocity Profile S-shaped ramp profiles are jerk-free. Seven ramp segments form the S-shaped ramp that can be optimally adapted to suit the user's requirements. High torque with high velocities can be reached by calibrating the bows of the ramp, as explained in this user manual.

Figure 3: S-shaped Velocity Profile

 More information on ramp configurations and other velocity profiles, e.g. sixPoint[™] ramps, are provided in chapter <u>6</u> (Page <u>24</u>).

Closed-loop Operation Feature A typical hardware setup for closed-loop operation with a TMC220x/222x stepper motor driver is shown in the figure below.

Figure 4: Hardware Set-up for Closed-loop Operation with TMC220x/222x

Reference Switch Support A typical hardware setup for open-loop operation with enhanced modifications, by use of external stop switches with the TMC2100 motor stepper driver is shown below. Home switches with different configurations are also supported.

Figure 5: Hardware Set-up for Open-loop Operation with TMC2100 supporting External Stop Switches

1.2. Pin Description

		P	in Names and Descriptions		
Pin Number Type Function					
			Supply Pins		
GND	6, 13, 22, 28	GND	Digital ground pin for IOs and digital circuitry.		
VCC	5, 23, 29	VCC	Digital power supply for IOs and digital circuitry (3.3V 5V).		
VDD1V8	14, 27	VDD	Connection of internal generated core voltage of 1.8V.		
CLK_EXT	30	Ι	Clock input to provide a clock with the frequency fCLK for all internal operations.		
NRST	31	I (PU)	Low active reset. If not connected, Power-on-Reset and internal pull-up resistor is active.		
TEST_MODE	26	Ι	Test mode input. Tie to low for normal operation.		
			Interface Pins for µC		
NSCSIN	2	Ι	Low active chip selects input of SPI interface to μ C.		
SCKIN	3	Ι	Serial clock for SPI interface to µC.		
SDIIN	4	Ι	Serial data input of SPI interface to µC.		
SDOIN	7	0	Serial data output of SPI interface to μ C (Z if NSCSIN=1).		
INTR	25	0	Interrupt output, programmable PD/PU for wired-and/or.		
TARGET_REACHED	24	0	Target reached output, programmable PD/PU for wired-and/or.		
			Reference Pins		
STOPL	10	I (PD)	Left stop switch. External signal to stop a ramp. If not connected, internal pull-down resistor is active.		
HOME_REF	11	I (PD)	Home reference signal input. External signal for reference search. If not connected, internal pull-down resistor is active.		
STOPR	12	I (PD)	Right stop switch. External signal to stop a ramp. If not connected, internal pull-down resistor is active.		
STPIN	15	I (PD)	Step input for external step control. If not connected, internal pull-down resistor is active.		
DIRIN	16	I (PD)	Direction input for external step control. If not connected, internal pull-down resistor is active.		
START	17	IO	Start signal input/output.		
		•	S/D Output Pins		
STPOUT PWMA	21	0	Step output. First PWM signal (Sine).		
DIROUT PWMB	20	0	Direction output. Second PWM signal (Cosine).

MAIN MANUAL

3. SPI Interfacing

TMC4330A uses 40-bit SPI datagrams for communication with a microcontroller. The bit-serial interface is synchronous to a bus clock. For every bit sent from the bus master to the bus slave, another bit is sent simultaneously from the slave to the master. In the following chapter information is provided about the SPI control interface, SPI datagram structure and SPI transaction process.

SPI Input Control Interface Pins					
Pin Name	Туре	Remarks			
NSCSIN	Input	Chip Select of SPI-µC interface (low active)			
SCKIN	Input	Serial clock of SPI-µC interface			
SDIIN	Input	Serial data input of SPI-µC interface			
SDOIN	Output	Serial data output of SPI-µC interface			

Table 3: SPI Input Control Interface Pins

3.1. SPI Datagram Structure

- Microcontrollers that are equipped with hardware SPI are typically able to communicate using integer multiples of 8 bit.
- The NSCSIN line of the TMC4330A has to stay active (low) for the complete duration of the datagram transmission.
- Each datagram that is sent to TMC4330A is composed of an address byte followed by four data bytes. This allows direct 32-bit data word communication with the register set of TMC4330A. Each register is accessed via 32 data bits; even if it uses less than 32 data bits.
- i Each register is specified by a one-byte address:
 - For read access the most significant bit of the address byte is 0.
 - For write access the most significant bit of the address byte is 1.

NOTE:

→ Some registers are write only registers. Most registers can be read also; and there are also some read only registers.

TMC4330A SPI Datagram Structure								
MSB (transmitted first)			40	bits		LS	B (transm	itted last)
39								0
→ 8-bit address \leftarrow 8-bit SPI status	\leftrightarrow 32-	\leftrightarrow \rightarrow 32-bit data						
39 32	31 0							
→ to TMC4330A: RW + 7-bit address ← from TMC4330A: 8-bit SPI status	8-bit data		8-bit	data	8-bit	data	8-bit	data
39 / 38 32	31.	24	23.	16	15.	8	7.	0
W 3832 39 38 37 36 35 34 33 32	3128 31 30 29 28	2724 27 26 25 24	2320 23 22 21 20	1916 19 18 17 16	1512 15 14 13 12	118 11 10 9 8	74 7 6 5 4	30 3 2 1 0

Figure 11: TMC4330A SPI Datagram Structure

Read and write selection is controlled by the MSB of the address byte (bit 39 of the **Read/Write** SPI datagram). This bit is 0 for read access and 1 for write access. Consequently, the Selection bit named W is a WRITE notREAD control bit. **Principles and Process** The active high write bit is the MSB of the address byte.

Consequently, 0x80 must be added to the address for a write access.

The SPI interface always delivers data back to the master, independent of the Write bit W.

Difference between Read and Write Access						
If	Then					
The previous access was a read access.	The data transferred back is the data read from the address which was transmitted with the previous datagram.					
The previous access was a write access	The data read back mirrors the previously received write data.					

Figure 12: Difference between Read and Write Access

Conclusion:

Consequently, the difference between a read and a write access is that the read access does not transfer data to the addressed register but it transfers the address only; and its 32 data bits are dummies.

NOTE:

 \rightarrow Please note that the following read delivers back data read from the address transmitted in the preceding read cycle. The data is latched immediately after the read request.

A read access request datagram uses dummy write data.

Read data is transferred back to the master with the subsequent read or write access.

i Reading multiple registers can be done in a pipelined fashion. Data that is delivered is latched immediately after the initiated data transfer.

For read access to register XACTUAL with the address 0x21, the address byte must be set to 0x21 in the access preceding the read access.

For write access to register VACTUAL, the address byte must be set to 0x80 + 0x22 = 0xA2. For read access, the data bit can have any value, e.g., 0.

Read and Write Access Examples							
Action	Data sent to TMC	Data received from TMC					
read XACTUAL	→ 0x210000000	\leftarrow 0xSS ¹⁾ & unused data					
read XACTUAL	→ 0x210000000	← 0xSS & XACTUAL					
write VACTUAL:= 0x00ABCDEF	→ 0xA200ABCDEF	← 0xSS & XACTUAL					
write VACTUAL:= 0x00123456	→ 0xA200123456	← 0xSS00ABCDEF					

Table 4: Read and Write Access Examples

¹⁾ SS is a placeholder for the status bits SPI_STATUS.

AREAS OF SPECIAL CONCERN

Use of Dummy Write Data

Read and Write Access Examples

Read entire documentation; especially the "Supplemental Directives" on page $\underline{160}$.

Data Alignment	All data is right-aligned. Some registers represent unsigned (positive) values; others
	represent integer values (signed) as two's complement numbers.
	Some registers consist of switches that are represented as bits or bit vectors.

SPI Transaction The SPI transaction process is as follows:

- The slave is enabled for SPI transaction by a transition to low level on the chip select input NSCSIN.
- Bit transfer is synchronous to the bus clock SCKIN, with the slave latching the data from SDIIN on the rising edge of SCKIN and driving data to SDOIN following the falling edge.
- The most significant bit is sent first.
- i A minimum of 40 SCKIN clock cycles is required for a bus transaction with TMC4330A.

Take the following aspects into consideration:

- Whenever data is read from or written to the TMC4330A, the first eight bits that are delivered back contain the SPI status *SPI_STATUS* that consists of eight user-selected event bits. The selection of these bits are explained in chapter <u>5.2.</u> (Page <u>22</u>).
 - **If less than 40 clock cycles are transmitted,** the transfer is not valid; even for read access. However, sending only eight clock cycles can be useful to obtain the SPI status because it sends the status information back first.
- **If more than 40 clocks cycles are transmitted,** the additional bits shifted into SDIIN are shifted out on SDOIN after a 40-clock delay through an internal shift register. This can be used for daisy chaining multiple chips.
- **NSCSIN must be low during the whole bus transaction**. When NSCSIN goes high, the contents of the internal shift register are latched into the internal control register and recognized as a command from the master to the slave. If more than 40 bits are sent, only the last 40 bits received *before the rising edge of NSCSIN -* are recognized as the command.

• MAIN MANUAL •

System Behavior Specifics

AREAS OF SPECIAL

CONCERN

Process

3.1.1. SPI Timing Description

The SPI interface is synchronized to the internal system clock, which limits SPI bus clock SCKIN to a quarter of the system clock frequency. The signal processing of SPI inputs is supported with internal Schmitt Trigger, but not with RC elements.

NOTE:

 \rightarrow In order to avoid glitches at the inputs of the SPI interface between μ C and TMC4330A, external RC elements have to be provided.

Figure <u>14</u> shows the timing parameters of an SPI bus transaction, and the table below specifies the parameter values.

SPI Interface Timing						
SPI Interface Timing	AC Chara	acteristics:	External clock period: tclk			
Parameter	Symbol	Conditions	Min	Туре	Max	Unit
SCKIN valid before or after change of NSCSIN	tcc		10			ns
NSCSIN high time	t _{сsн}	Min. time is for synchronous CLK with SCKIN high one t_{CH} before SCSIN high only.	t _{ськ}	>2·t _{CLK} +10		ns
SCKIN low time	tcL	Min. time is for synchronous CLK only.	t clk	>t _{CLK} +10		ns
SCKIN high time	tсн	Min. time is for synchronous CLK only.	t clk	>t _{CLK} +10		ns
SCKIN frequency using external clock (Example: f _{CLK} = 16 MHz)	fscк	Assumes synchronous CLK.			f _{ськ} / 4 (4)	MHz
SDIIN setup time before rising edge of SCKIN	tou		10			ns
SDIIN hold time after rising edge of SCKIN	t _{DH}		10			ns
Data out valid time after falling SCKIN clock edge	t _{DO}	No capacitive load on SDOIN.			t _{FILT} +5	ns

Table 5: SPI Interface Timing

і *tclк* = 1 / f*clк*

4. Input Filtering

Input signals can be noisy due to long cables and circuit paths. To prevent jamming, every input pin provides a Schmitt trigger. Additionally, several signals are passed through a digital filter. Particular input pins are separated into four filtering groups. Each group can be programmed individually according to its filter characteristics. In this chapter informed on the digital filtering feature of TMC4330A is provided; and how to separately set up the digital filter for input pins.

Input Filtering Groups				
Pin Names	Туре	Remarks		
A_SCLK B_SDI N ANEG_NSCLK BNEG_NSDI NNEG	Inputs	Encoder interface input pins.		
STOPL HOME_REF STOPR	Inputs	Reference input pins.		
START	Input	START input pin.		
STPIN DIRIN	Inputs	Step/Dir interface inputs.		

Table 6: Input Filtering Groups (Assigned Pins)

Register Names					
Register Names Register Address			Remarks		
INPUT_FILT_CONF	0x03	RW	Filter configuration for all four input groups.		

Table 7: Input Filtering (Assigned Register)

Input FilterEvery filtering group can be configured separately with regard to input sample rate
and digital filter length.

The following groups exist:

- Encoder interface input pins.
- Reference input pins.
- Start input pin.
- Step/Dir input pins.

NOTE:

→ For the correct set-up of the INPUT_FILT_CONF register 0x03, please check section <u>14.4.</u>, page <u>128</u>.

Input Sample Rate (SR)

Input sample rate = $f_{CLK} 1/2^{SR}$ where:

 SR (extended with a particular name extension) is in [0... 7].

This means that the next input value is considered after 2^{SR} clock cycles. i

Sample Rate Configuration

Sample Rate Configuration				
SR Value	Sample Rate			
0	fak			
1	fak/2			
2	fak/4			
3	fak/8			
4	fax/16			
5	fa.k/32			
6	fak/64			
7	faк/128			

Table 8: Sample Rate Configuration

Digital Filter The filter length *FILT_L* can be set within the range [0... 7]. i Length (FILT_L)

The filter length *FILT_L* specifies the number of sampled bits that must have the i same voltage level to set a new input bit voltage level.

	Configuration of Digital Filter Length				
<i>FILT_L</i> value	Filter Length				
0	No filtering.				
1	2 equal bits.				
2	3 equal bits.				
3	4 equal bits.				
4	5 equal bits.				
5	6 equal bits.				
6	7 equal bits.				
7	8 equal bits.

Length Configuration Table

Digital Filter

4.1. Input Filtering Examples

The following three examples depict input pin filtering of three different input filtering groups.

- i After passing Schmitt trigger, voltage levels are compared to internal signals, which are processed by the motion controller.
- i The sample points are depicted as green dashed lines.

Example 1:In this example every second clock cycle is sampled. Two sampled inputReference Inputbits must be equal to receive a valid input voltage.Pins

Figure 14: Reference Input Pins: SR_REF = 1, FILT_L_REF = 1

Example 2: START Input Pin

This example shows the START input pattern at every fourth clock cycle:

Figure 15: START Input Pin: SR_S = 2, FILT_L_S = 0

Example 3: Encoder Interface Input Pins

This example shows every clock cycle bit. Eight sampled input bits must be equal to receive a valid input voltage.

Figure 16: Encoder Interface Input Pins: SR_ENC_IN = 0, FILT_L_ENC_IN = 7

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

Read entire documentation; especially the "<u>Supplemental Directives</u>" on page <u>160</u>.

5. Status Flags and Events

TMC4330A provides several status flags and status events to obtain short information on the internal status or motor driver status. These flags and events can be read out from dedicated registers. In the following chapter, you are informed about the generation of interrupts based on status events. Status events can also be assigned to the first eight SPI status bits, which are sent within each SPI datagram.

Pin Names: Status Events					
Pin Names Type Remarks					
INTR	Output	Interrupt output to indicate status events.			

Table 10: Pins Names: Status Events

Register Names: Status Flags and Events					
Register Name	Register Name Register Address		Remarks		
GENERAL_CONF	0X00	RW	Bits: 15, 29, 30.		
STATUS_FLAGS	0X0F	R	32 status flags of TMC4330A and the connected TMC motor driver chip.		
EVENTS	0X0E	R+C W	32 events triggered by altered TMC4330A status bits.		
SPI_STATUS_SELECTION	0X0B	RW	Selection of 8 out of 32 events for SPI status bits.		
EVENT_CLEAR_CONF	0X0C	RW	Exceptions for cleared event bits.		
INTR_CONF	0X0D	RW	Selection of 32 events for INTR output.		

Table 11:Register Names: Status Flags and Events

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: www.trinamic.com .

5.1. Status Event Description

Status events are based on status bits. If the status bits change, related events are triggered from inactive to active level. Resetting events back to inactive must be carried out manually.

Association of Status Bits Status bits and status events are associated in different ways:

- Status flags reflect the as-is-condition, whereas status events indicate that the dedicated information has changed since the last read request of the *EVENTS* register. Several status events are associated with one status bit.
- Some status events show the status transition of one or more status bits out of a status bit group.
- In case a flag consists of more than one bit, the number of associated events that can be triggered corresponds to the valid combinations. The *VEL_STATE* flag, e.g., has two bit but three associated velocity state events (b'00/b'01/b'10). Such an event is triggered if the associated combination switches from inactive to active.

<u>NOTE:</u>

 \rightarrow Some events have no equivalence in the STATUS_FLAGS register 0x0F.

Automatic Clearance of EVENTS

AREAS OF SPECIAL CONCERN

How to Avoid Lack of Information The *EVENTS* register 0x0E is automatically cleared after reading the register; subsequent to an SPI datagram request. Events are important for interrupt generation and SPI status monitoring.

NOTE:

→ It is recommended to clear EVENTS register 0x0E by read request before regular operation.

Recognition of a status event can fail; in case it is triggered right before or during *EVENTS* register 0x0E becomes cleared.

In order to prevent events from being cleared, assign *EVENT_CLEAR_CONF* register 0x0C according to the particular event in the EVENTS register:

Action:

> Set related *EVENT_CLEAR_CONF* register bit position to 1.

Result:

The related event is not cleared when *EVENTS* register is read out.

In order to clear these events, do the following, if necessary:

Action:

> Set related *EVENTS* register 0x0E bit position to 1.

Result:

The related event is cleared by writing to the *EVENTS* register.

5.2. SPI Status Bit Transfer

Up to eight events can be selected for permanent SPI status report. Consequently, these events are always transferred at the most significant transfer bits within each TMC4330A SPI response.

Assign an Event In order to select an event for the SPI status bits, assign the SPI_STATUS_SELECTION register 0x0B according to the particular event in the EVENTS register:

Action:

> Set the related *SPI_STATUS_SELECTION* register bit position to 1.

Result:

The related event is transferred with every SPI datagram response as SPI_STATUS.

NOTE:

→ The bit positions are sorted according to the event bit positions in the EVENTS register 0x0E. In case more than eight events are selected, the first eight bits (starting from index 0 = LSB) are forwarded as SPI_STATUS.

5.3. Generation of Interrupts

Polarity

Similar to *EVENT_CLEAR_CONF* register and *SPI_STATUS_SELECTION* register, events can be selected for forwarding via INTR output. The selected events are ORed to one signal which means that INTR output switches active as soon as one of the selected events triggers.

GenerateIn order to select an event for the INTR output pin, assign the INTR_CONFInterruptsregister 0x0D according to the particular event in the EVENTS register:

Action:

> Set the related *INTR_CONF* register bit position to 1.

Result:

The related event is forwarded at the INTR output. If more than one event is requested, INTR becomes active as soon as one of the selected events is active.

INTR Output Per default, the INTR output is low active.

In order to change the INTR polarity to high active, do the following:

Action:

Set intr_pol =1 (GENERAL_CONF register 0x00).

Result:

INTR is high active.

5.4. Connection of Multiple INTR Pins

INTR pin can be configured for a shared interrupt signal line of several TMC4330A interrupt signals to the microcontroller.

Connecting several	In order to make use of a Wired-Or or Wired-And behavior, the below described actions must be taken:
Interrupt Pins	<pre>Action: Step 1: Set intr_tr_pu_pd_en = 1 (GENERAL_CONF register 0x00).</pre>

OPTION 1: WIRED-OR

Action:

Step 2: Set intr_as_wired_and = 0 (GENERAL_CONF register 0x00).

Result:

The INTR pin works efficiently as Wired-Or (default configuration).

i In case INTR pin is inactive, the pin drive has a weak inactive polarity output. If one of the connected pins is activated, the whole line is set to active polarity.

OPTION 2: WIRED-AND

Action:

> **Step 2:** Set *intr_as_wired_and* = 1 of the *GENERAL_CONF* register 0x00.

Result:

In case no interrupt is active, the INTR pin has a strong inactive polarity output. During the active state, the pin drive has a weak active polarity output. Consequently, the whole signal line is activated in case all pins are forwarding the active polarity.

6. Ramp Configurations for different Motion Profiles

Step generation is one of the main tasks of a stepper motor motion controller. The internal ramp generator of TMC4330A provides several step generation configurations with different motion profiles. They can be configured in combination with the velocity or positioning mode.

Pin Names: Ramp Generator				
Pin Names Type Remarks				
STPOUT_PWMA	Output	Step output signal.		
DIROUT_PWMB Output Direction output signal.				

Table 12: Pin Names: Ramp Generator

Register Names: Ramp Generator					
Register Name	Register Address		Remarks		
GENERAL_CONF	0x00	RW	Ramp generator affecting bits 5:0.		
STP_LENGTH_ADD			Additional step length in clock cycles; 16 bits.		
DIR_SETUP_TIME	0x10	RW	Additional time in clock cycles when no steps will occur after a direction change; 16 bits.		
RAMPMODE	0x20	RW	Requested motion profile and operation mode; 3 bits.		
XACTUAL	0x21	RW	Current internal microstep position; signed; 32 bits.		
VACTUAL	0x22	R	Current step velocity; 24 bits; signed; no decimals.		
AACTUAL	0x23	R	Current step acceleration; 24 bits; signed; no decimals.		
VMAX	0x24	RW	Maximum permitted or target velocity; signed; 32 bits= 24+8 (24 bits integer part, 8 bits decimal places).		
VSTART	0x25	RW	Velocity at ramp start; unsigned; 31 bits=23+8.		
VSTOP	0x26	RW	Velocity at ramp end; unsigned; 31 bits=23+8.		
VBREAK	0x27	RW	At this velocity value, the aceleration/deceleration will change during trapezoidal ramps; unsigned; 31 bits=23+8.		
AMAX	0x28	RW	Maximum permitted or target acceleration; unsigned; 24 bits=22+2 (22 bits integer part, 2 bits decimal places).		
DMAX	0x29	RW	Maximum permitted or target deceleration; unsigned; 24 bits=22+2.		
ASTART	0x2A	RW	Acceleration at ramp start or below VBREAK; unsigned; 24 bits=22+2.		
DFINAL	0x2B	RW	Deceleration at ramp end or below VBREAK; unsigned; 24 bits=22+2.		
BOW1	0x2D	RW	First bow value of a complete velocity ramp; unsigned; 24 bits=24+0 (24 bits integer part, no decimal places).		
BOW2	0x2E	RW	Second bow value of a complete velocity ramp; unsigned; 24bits=24+0.		
BOW3	0x2F	RW	Third bow value of a complete velocity ramp; unsigned; 24 bits=24+0.		
BOW4	0x30	RW	Fourth bow value of a complete velocity ramp; unsigned; 24 bits=24+0.		
CLK_FREQ	0x31	RW	External clock frequency fack; unsigned; 25 bits.		
XTARGET	0x37	RW	Target position; signed; 32 bits.		

Table 13: Register Names: Ramp Generator

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

Read entire documentation; especially the "Supplemental Directives" on page <u>160</u>.

6.1. Step/Dir Output Configuration

This section focuses on the description of the Step/Dir output configuration.

6.1.1. Step/Dir Output Configuration Steps

Step/Dir output signals can be configured for the driver circuit.

If step signals must be longer than one clock cycle, do as follows:

Action:

> Set proper *STP_LENGTH_ADD* register 0x10 (bit 15:0).

Result:

The resulting step length is equal to *STP_LENGTH_ADD*+1 clock cycles. This is how the step length is assigned within a range of up to 1-up-to-2¹⁶ clock cycles.

Action:

Set proper DIR_SETUP_TIME register 0x10 (bit 31:16).

Result:

The delay period between DIROUT and STPOUT voltage level transitions last *DIR_SETUP_TIME* clock cycles. No steps are sent via STPOUT for *DIR_SETUP_TIME* clock cycles after a level change at DIROUT.

PRINCIPLE:

DIROUT does not change the level:

- During active step pulse signal
- For (STP_LENGTH_ADD+1) clock cycles after the step signal returns to inactive level

STPOUT characteristics can be set differently, as follows:

Per default, the step output is high active because a rising edge at STPOUT indicates a step.

In order to change the polarity, do as follows:

Action:

Set step_inactive_pol =1 (bit3 of GENERAL_CONF register 0x00).

Result:

Each falling edge indicates a step.

How to prompt Level Change with every Step

6.1.2.

STPOUT:

Changing

Polarity

In order to prompt a step at every level change, do as follows:

Action:

Set toggle_step =1 (bit4 of GENERAL_CONF register 0x00).

Result:

Every level change indicates a step.

DIROUT: Changing the Polarity

Per default, voltage level 1 at DIROUT indicates a negative step direction. DIROUT characteristics can be set differently, as shown below.

In order to change polarity, do as follows:

Action:

Set pol_dir_out =0 (bit5 of GENERAL_CONF register 0x00).

Result:

A high voltage level at DIROUT indicates a positive step direction.

6.2. Configuration Details for Operation Modes and Motion Profiles

This section provides information on the two available operation modes (velocity mode and positioning mode), and on the four possible motion profiles (no ramp, trapezoidal ramp including sixPoint[™] ramp, and S-shaped ramp). Different combinations are possible. Each one of them has specific advantages. The choice of configuration depends on the user's design specification to best suit his design needs.

Description of
Internal RampWith proper configuration, the internal ramp generator of the TMC4330A is able to
generate various ramps with the related step outputs for STPOUT.GeneratorIn order to configure the internal ramp generator successfully.

In order to configure the internal ramp generator successfully -i.e. to make it fit as best as possible with your specific use case - information about the scope of each possible combination is provided in the table below and on the following pages.

	Ramp Generator Configuration Options						
Operation Mode	Motion Profile	RAMPMODE(2:0)	Description				
	No ramp	b′000	Follows VMAX request only.				
	Trapezoidal ramp	b′001	Follows <i>VMAX</i> request and considers acceleration and deceleration values.				
Velocity Mode	sixPoint ramp	b′001	Follows VMAX request and considers acceleration / deceleration values and start and stop velocity values.				
	S-shaped ramp	b′010	Follows <i>VMAX</i> request and considers maximum acceleration / deceleration values and adapts these values with 4 different bow values.				
	No Ramp	b′100	Follows XTARGET and VMAX requests only.				
Positioning Mode	Trapezoidal ramp	b′101	Follows <i>XTARGET</i> request and a maximum velocity <i>VMAX</i> request and considers acceleration and deceleration values.				
	sixPoint ramp	b'101	Follows <i>XTARGET</i> request and a maximum velocity <i>VMAX</i> request and considers acceleration / deceleration values and start and stop velocity values.				
	S-shaped ramp	b′110	Follows XTARGET request and a maximum velocity VMAX request and considers maximum acceleration / deceleration values and adapts these values with 4 different bow values.				

Table 14: Overview of General and Basic Ramp Configuration Options

Two operation modes are available: velocity mode and positioning mode.

-						
BEFORE YOU BEGIN	Before setting any parameters:					
	First select:					
	 Operation mode and Motion profile 					
	It is not advisable to change operation mode nor motion profile during motion.					
Operation Mode: Velocity Mode	The <i>RAMPMODE</i> register provides a choice of two operation modes. Either velocity mode or positioning mode can be chosen.					
	In order to use the velocity mode, do as follows:					
	Action: ➤ Set <i>RAMPMODE</i> (2) =0 (<i>RAMPMODE</i> register 0x20).					
	Result: Velocity mode is selected. The target velocity <i>VMAX</i> is reached with the selected motion profile.					
Operation Mode:	In order to make use of the positioning mode, do as follows:					
Positioning Mode	Action: ➤ Set <i>RAMPMODE</i> (2)=1 (<i>RAMPMODE</i> register 0x20).					
	Result: Positioning mode is selected. <i>VMAX</i> is the maximum velocity value of this motion profile that is based on the condition that the ramp stops at target position <i>XTARGET</i> .					
	<u>NOTE:</u>					
	→ The sign of VMAX is not relevant during positioning. The direction of the steps depends on XACTUAL, XTARGET, and the current ramp motion profile status.					
	<u>NOTE:</u>					
	\rightarrow Do NOT exceed VMAX $\leq f_{CLK}$ ¼ pulses for positioning mode.					
6.2.2.	In order to stop the motion during positioning, do as follows:					
Stop during Motion	Action: > Set $VMAX = 0$ (register 0x24).					
	Result: The velocity ramp directs to VACTUAL = 0, using the actual ramp parameters.					
	i Motion is proceeded with $VMAX \neq 0$.					

• MAIN MANUAL •

Read entire documentation; especially the "<u>Supplemental Directives</u>" on page <u>160</u>.

6.2.3. Motion Profile Configuration

Three basic motion profiles are provided. Each one of them has a different velocity value development during the drive. See table below.

For configuration of the motion profiles, do as follows:

Action:

Use the bits 1 and 0 of the RAMPMODE register 0x20.

Result:

As specified in the table below.

You can choose different configuration options from the list below:

- No Ramp motion profile
- Trapezoidal Ramp motion profile (including sixPoint Ramp)
- S-shaped Ramp motion profiles

TMC4330A Motion Profile			
RAMPMODE (1:0)	Motion Profile	Function	
b'00	No Ramp	Follow VMAX only (rectangular velocity shape).	
	Trapezoidal Ramp	Consideration of acceleration and deceleration values without adaptation of these acceleration values.	
b′01	sixPoint Ramp	Consideration of acceleration and deceleration values without adaptation of these acceleration values. Usage of start and stop velocity values. (see section <u>6.5.</u> , Page <u>41</u>)	
b'10	S-shaped Ramp	Use all ramp values (including bow values).	

Table 15: Description of TMC4330A Motion Profiles

6.2.4. No Ramp Motion Profile

In order to make use of the no ramp motion profile, which is rectangular, do as follows:

Action:

- Set RAMPMODE(1:0) =b'00 (register 0x20).
- > Set proper *VMAX* register 0x24.

Result:

The internal velocity VACTUAL is immediately set to VMAX.

Positioning Mode combined with No Ramp Motion Profile Combining positioning mode with the no ramp motion profile determines that the ramp holds *VMAX* until *XTARGET* is reached. The motion direction depends on *XTARGET*.

In order to make use of the no ramp motion profile in combination with the positioning mode, do as follows:

Action:

- Set *RAMPMODE*(2:0) =b'100.
- Set proper VMAX register 0x24.
- ➢ Set proper XTARGET register 0x37.

Result:

VACTUAL is set instantly to 0 in case the target position is reached.

<u>NOTE:</u>

 \rightarrow Do NOT exceed VMAX $\leq f_{CLK}/4$ pulses for positioning mode.

6.2.5. Trapezoidal 4-Point Ramp without Break Point

In order to make use of a trapezoidal 4-point ramp motion profile without break velocity, do as follows:

Action:

- Set *RAMPMODE*(1:0) =b'01 (register 0x20).
- ➢ Set VBREAK =0 (register 0x27).
- > Set proper AMAX register 0x28 and DMAX register 0x29.
- ➢ Set proper VMAX register 0x24.

Result:

The internal velocity *VACTUAL* is changed successively to *VMAX* with a linear ramp. Only *AMAX* and *DMAX* define the acceleration/deceleration slopes.

NOTE:

- → AMAX determines the rising slope from absolute low to absolute high velocities, whereas DMAX determines the falling slope from absolute high to absolute low velocities.
- → Acceleration slope and deceleration slopes have only one acceleration and deceleration value each.

Figure 18: Trapezoidal Ramp without Break Point

Figure 19: Trapezoidal Ramp with Break Point

6.2.6. Trapezoidal Ramp with Break Point

In order to make use of a trapezoidal ramp motion profile with break velocity, do as follows:

Action:

- > Set *RAMPMODE*(1:0)=b'01 (register 0x20).
- > Set proper *VBREAK* register 0x27.
- > Set proper AMAX register 0x28 and DMAX register 0x29.
- > Set proper ASTART register 0x2A and DFINAL register 0x2B.
- ➢ Set proper VMAX register 0x24.

Result:

The internal velocity *VACTUAL* is changed successively to *VMAX* with a linear ramp. In addition to *AMAX* and *DMAX*, *ASTART* and *DFINAL* define the acceleration or deceleration slopes (see Figure above).

<u>NOTES:</u>

- → AMAX and ASTART determines the rising slope from absolute low to absolute high velocities.
- \rightarrow DMAX and DFINAL determines the falling slope from absolute high to absolute low velocities.
- → The acceleration/deceleration factor alters at VBREAK. ASTART and DFINAL are valid below VBREAK, whereas AMAX and DMAX are valid beyond VBREAK.

Motion direction depends on XTARGET.

In order to use a 4-point or sixPoint ramps during positioning mode, do as follows:

Action:

- Set *RAMPMODE*(2:0) =b'101 (register 0x20).
- > Set Trapezoidal ramp type accordingly, as explained above.
- Set proper *XTARGET* register 0x37.

Result:

The ramp finishes exactly at the target position XTARGET by keeping |VACTUAL| = VMAX as long as possible.

AACTUAL Assignments for Trapezoidal Ramps

AACTUAL assignments apply both for 4-point and sixPoint ramps.

The acceleration/deceleration factor *AACTUAL* register depends on the current ramp phase and the velocity that needs to be reached. The related sign assignment for different ramp phases is given in the following table:

AACTUAL ASSIGNMENTS for Trapezoidal Ramps					
Ramp phase:	A1L	A 1	A ₂	A 3	A _{3L}
<i>v>0:</i> AACTUAL <i>=</i>	ASTART	AMAX	0	-DMAX	-DFINAL
<i>v<0:</i> AACTUAL <i>=</i>	-ASTART	-AMAX	0	DMAX	DFINAL

Table 16: Trapezoidal Ramps: AACTUAL Assignments during Motion

6.2.8. Configuration of S-Shaped Ramps

In order to make use of S-shaped ramps, do as follows:

Action:

- Set RAMPMODE(1:0)=b'10 (register 0x20).
- > Set proper *BOW1* ... *BOW4* registers 0x2C...0x30.
- > Set proper AMAX register 0x28 and DMAX register 0x29.
- > Set ASTART = 0 (register 0x2A).
- ➢ Set DFINAL = 0 (register 0x2B).
- > Set proper VMAX register 0x24.

Result:

The internal velocity *VACTUAL* is changed successively to *VMAX* with S-shaped ramps. The acceleration/deceleration values are altered on the basis of the bow values.

Figure 20: S-shaped Ramp without initial and final Acceleration/Deceleration Values

Definition of Rising Slope for S-shaped Ramps

Rising slope (absolute lower velocities to absolute higher velocities):

- *BOW1* determines the value which increases the absolute acceleration value.
- BOW2 determines the value which decreases the absolute acceleration value.
- *AMAX* determines the maximum acceleration value.

Definition of Falling Slope for S-shaped Ramps

Falling slope (absolute higher velocities to absolute lower velocities):

- *BOW3* determines the value which increases the absolute deceleration value.
- BOW4 determines the value which decreases the absolute deceleration value.
- DMAX determines the maximum absolute deceleration value.
- •→ Description is continued on next page.

Read entire documentation; especially the "Supplemental Directives" on page 160.

.

Changing ramp parameters¹ and/or operation mode during motion is not advised. However, if this is necessary, the following applies:

NOTICE

Avoid unintended system behavior during positioning mode! Ramp parameter value changes during ramp progress can lead to:

- A temporary overshooting of *XTARGET* or mechanical stop positions.
- A temporary overshooting of *VACTUAL* beyond *VMAX* because the bows B1, B2, B3, and B4 are maintained during the ramp progress.

This will ensure smooth operation during positioning mode.

¹ Exceptions are XTARGET and VMAX. These Parameters can be changed during motion.

However, if it is necessary to change ramp parameters for S-shaped ramps during motion or to swtich from velocity to positioning mode, do as follows:

Action:

- Set or set again proper BOW3 registers 0x2F, regardless of wether the value changes or not.
 - i Set this parameter after all other parameters have been set.

Result:

Internal ramp calculations are reset through which the velocity ramp operates at safe mode. During this mode, the target velocity is set to 0. In case the internal ramp calculations are up-to-date, the ramp, which is configured by the actual ramp parameters, is continued.

In order to configure S-shaped ramps with starting and finishing values for acceleration or deceleration, do as follows:

Action:

- > Set *RAMPMODE*(1:0)=b'10 (register 0x20).
- > Set S-Shaped ramp as explained above (BOW1 ... BOW4, AMAX, DMAX).
- Set proper *ASTART* register 0x2A.
- > Set proper *DFINAL* register 0x2B.
- ➢ Set proper VMAX register 0x24.

Result:

The internal velocity VACTUAL is changed successively to VMAX with S-Shaped ramps.

Figure 21: S-shaped Ramp with initial and final Acceleration/Deceleration Values

● → Description is continued on next page.

Changing Ramp Parameters during S-shaped Motion or Switching to Positiong Mode

6.2.9.

6.2.10.

DFINAL

Configuration of

S-shaped Ramp

with ASTART and

• The acceleration/deceleration values are altered, based on the bow values.

Definitions for S-shaped Ramps

- The start phase and the end phase of an S-shaped ramp is accelerated/decelerated by *ASTART* and *DFINAL*.
- The ramp starts with *ASTART* and stops with *DFINAL*.
- DFINAL becomes valid when AACTUAL reaches the chosen DFINAL value.
- i The parameter *DFINAL* is not considered during positioning mode.

AACTUALAACTUAL assignments and current bow value selection for S-shaped ramps.Assignments for
S-shaped RampsThe acceleration/deceleration factor depends on the current ramp phase and alters
every 64 clock cycles during the bow phases B1, B2, B3, and B4.

Details are provided in the table below:

S-shaped Ramps: Assignments for AACTUAL and Internal Bow Value							
Ramp phase:	B 1	B 12	B ₂	B 23	B ₃	B ₃₄	B 4
v>0: AACTUAL=	ASTART→AMAX	AMAX	<i>AMAX</i> →0	0	$0 \rightarrow -DMAX$	-DMAX	-DMAX→ -DFINAL
BOW _{ACTUAL} =	BOW1	0	-BOW2	0	-BOW3	0	BOW4
v<0: <i>AACTUAL</i> =	-ASTART→-AMAX	-AMAX	<i>-AMAX</i> →0	0	$0 \rightarrow DMAX$	DMAX	$DMAX \rightarrow DFINAL$
BOW _{ACTUAL} =	-BOW1	0	BOW2	0	BOW3	0	-BOW4

Table 17: Parameter Assignments for S-shaped Ramps

6.2.11. S-shaped Mode and Positioning: Fast Motion

RAMPMODE(2:0) =b'110

- The ramp finishes exactly on target position; keeping | VACTUAL| = VMAX as long as possible until the ramp falls to reach XTARGET exactly.
- It is possible that the phases B12, B23, and B34 are left out due to given values. Therefore, the highest speed performance is possible due to a maximum speed positioning ramp.
- The fastest possible slopes are always performed if the phases B12 and/or B34 are not reached during a rising and/or falling S-shaped slope.
- The ramp maintains the maximum velocity *VMAX* as long as possible in positioning mode until the falling slope finishes the ramp to reach *XTARGET* exactly. The result is the fastest possible positioning ramp in matters of time.

6.3. Start Velocity VSTART and Stop Velocity VSTOP

S-shaped and trapezoidal velocity ramps can be configured with unsigned start and stop velocity values: V*START*, or *VSTOP*.

Per default, *VSTART* and *VSTOP* are set to 0. The sign is selected automatically, depending on the current ramp status and the target velocity, or target position. This section explains how to set up the respective values correctly.

Starting Ramps with initial Velocity	S-shaped and trapezoidal velocity ramps can be started with an initial velocity value, if you set the <i>VSTART</i> value higher than zero (see Figure below).				
	In order to use trapezoidal ramps with an initial start velocity, do as follows:				
	Action:				

- Set RAMPMODE(1:0)=b'01 (register 0x20).
- > Set Trapezoidal ramp type accordingly, as explained before.
- ➢ Set proper VSTART > 0 (register 0x25).
- > Set VSTOP = 0 (register 0x26).

Result:

The trapezoidal ramp starts with initial velocity.

NOTE:

→ The initial acceleration value is AMAX if VBREAK < VSTART, otherwise the starting acceleration value is ASTART.

Figure 22: Trapezoidal Ramp with initial Velocity

If trapezoidal ramp with initial velocity *VSTART* is selected:

NOTICE

Avoid unintended system behavior during positioning mode!

Use VSTART without setting VSTOP > VSTART only in positioning mode if there
is enough distance between the current position XACTUAL and the target
position XTARGET.

This will ensure smooth operation during positioning mode.

• \rightarrow Turn page for information on how to configure S-shaped ramps with initial start velocity.

S-shaped Ramps with initial Start Velocity

In order to use S-shaped ramps with initial start velocity, do as follows: Action:

- Set *RAMPMODE*(1:0)=b'10 (register 0x20).
- ➢ Set S-shaped ramp type accordingly, as explained before.
- Set proper VSTART > 0 (register 0x25).
- > Set VSTOP = 0 (register 0x26).

Result:

The S-shaped ramp starts with initial velocity.

PRINCIPLE:

→ The initial acceleration value is equal to AMAX. The parameter ASTART is not considered. Consequently, ramp phase B1 is not performed.

Figure 23: S-shaped Ramp with initial Start Velocity

If S-shaped ramp with initial velocity *VSTART* is selected:

NOTICE

Avoid unintended system behavior during positioning mode!

- Keep in mind that the S-shaped character of the curve is maintained. Because *AMAX* is the start acceleration value, the ramp will always execute phase B2 which could result in positioning overshoots.
- Use *VSTART* only in positioning mode if there is enough distance between the current position *XACTUAL* and the target position *XTARGET*.

This will ensure smooth operation during positioning mode.

●→Turn page for information on how to configure finishing ramps with stop velocity.

Finishing Ramps with Stop Velocity

S-shaped and trapezoidal velocity ramps can be finished with a stop velocity value if you set *VSTOP* value higher than zero (see figure below).

In order to configure trapezoidal ramps with stop velocity, do as follows:

Action:

- Set RAMPMODE(1:0)=b'01 (register 0x20).
- > Set Trapezoidal ramp type accordingly, as explained before.
- > Set VSTART = 0 (register 0x25).
- Set proper VSTOP > 0 (register 0x26).

Result:

The trapezoidal ramp stops with defined velocity.

Figure 20: Trapezoidal Ramp with Stop Velocity

If trapezoidal ramps are selected (*VBREAK* > 0):

NOTICE

63

- Avoid unintended system behavior during positioning mode!
- Set *VBREAK* > *VSTOP*.
- Set *VSTART < VSTOP*.

This will ensure smooth operation during positioning mode.

●→Turn page for configuration information on S-shaped ramps with stop velocity.

S-shaped Ramps with Stop Velocity

In order to use S-shaped ramps with stop velocity, do as follows:

Action:

- Set RAMPMODE(1:0)=b'10 (register 0x20).
- > Set S-shaped ramp type accordingly, as explained before.
- > Set VSTART = 0 (register 0x25).
- Set proper VSTOP > 0 (register 0x26).

Result:

The S-shaped ramp finishes with stop velocity.

NOTE:

→ The final deceleration value is equal to DMAX. The parameter DFINAL is not considered. Consequently, ramp phase B4 is not performed.

Figure 24: S-shaped Ramp with Stop Velocity

Interaction of VSTART, VSTOP, VACTUAL and VMAX:

- *VSTOP* can be used in positioning mode, if the target position is reached. In velocity mode, *VSTOP* is also used if *VACTUAL* ≠ 0 and the target velocity *VMAX* is assigned to 0.
- *VSTART* and *VSTOP* are not only used to start or end a velocity ramp. If the velocity direction alters due to register assignments while a velocity ramp is in progress, the velocity values develop according to the current velocity ramp type, using *VSTART* or *VSTOP*.
- The unsigned values *VSTART* and *VSTOP* are valid for both velocity directions.
- Every register value change is assigned immediately.

•→Turn page for information on how to configure S-shaped ramps with start and stop velocity.

63

6.3.1. S-shaped Ramps with Start and Stop Velocity

S-shaped ramps can be configured with a combination of *VSTART* and *VSTOP*. It is possible to include both processes in one S-Shaped ramp to decrease the time between start and stop of the ramp.

In order to use S-Shaped ramps with a combination of start and stop velocity, do as follows:

Action:

- ➢ Set *RAMPMODE*(1:0)=b'10.
- > Set S-shaped ramp type accordingly, as explained before, but with BOW2 \neq BOW4.
- ➢ Set proper VSTART > 0 (register 0x25).
- ➢ Set proper VSTOP > 0 (register 0x26).

Result:

The S-shaped ramp starts with initial velocity and stops with defined velocity.

If S-shaped ramp with initial velocity *VSTART* and stop velocity *VSTOP* is selected:

NOTICE

Avoid unintended system behavior during positioning mode!

- Keep in mind that the S-shaped character of the curve is maintained. Because *AMAX* is the start acceleration value, the ramp will always execute phase B2, which could result in positioning overshoots.
- Use *VSTART* in positioning mode, if there is enough distance between the current position *XACTUAL* and the target position *XTARGET*.

This will ensure smooth operation during positioning mode.

●→Turn page for information on how to use VSTART and ASTART for S-shaped ramps.

40/166

6.3.2. Combined Use of *VSTART* and *ASTART for S-shaped Ramps* For some S-shaped ramp applications it can be useful to start with a defined velocity value (VSTART > 0); but not with the maximum acceleration value AMAX.

In order to start with a defined velocity value, do as follows:

Action:

- Set *RAMPMODE*(1:0) =b'10 (register 0x20).
- > Set S-shaped ramp type accordingly, as explained before.
- ➢ Set proper VSTART > 0 (register 0x25).
- ➢ Set proper VSTOP > 0 (register 0x26).
- Set use_astart_and_vstart =1 (bit0 of the GENERAL_CONF register 0x00).

Result:

The following special ramp types can be generated in this way, as shown below.

i Section B1 is passed through although VSTART is used.

Using VSTART and starting acceleration of 0 for S-shaped ramps

Figure 26: S-shaped Ramps with combined VSTART and ASTART Parameters

If S-shaped ramp with VSTART, ASTART, and VSTOP is selected:

NOTICE

Avoid unintended system behavior during positioning mode!

- Keep in mind that the S-shaped character of the curve is maintained. Because *ASTART* is the start acceleration value, the ramp will always execute phase B2, which could result in positioning overshoots.
- Use *VSTART* and *ASTART* > 0 without setting *VSTOP* > *VSTART* only in positioning mode, if there is enough distance between the current position *XACTUAL* and the target position *XTARGET*.

This will ensure smooth operation during positioning mode.

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

6.4. sixPoint Ramps

sixPoint ramps are trapezoidal ramps with initial and stop velocity values that also make use of two acceleration and two deceleration values.

Configuration of
sixPoint RampssixPoint ramps are trapezoidal velocity ramps that can be configured with a
combination of *VSTART* and *VSTOP*.

In order to use trapezoidal ramps with a combination of start and stop velocity, do as follows:

Action:

- Set RAMPMODE(1:0)=b'01 (register 0x20).
- > Set a Trapezoidal ramp type appropriately as explained in section 6.2.6, page 30.
- > Set proper *VSTART* > 0 (register 0x25).
- ➤ Set proper VSTOP > 0 (register 0x26).
- > Set proper *VBREAK* > 0 (register 0x27).

Result:

The sixPoint ramp starts with an initial velocity and stops with a defined velocity.

Diagram of sixPoint Ramp

Figure 27: sixPoint Ramp: Trapezoidal Ramp with Start and Stop Velocity

If a sixPoint ramp is used:

NOTICE

- Set VBREAK > VSTOP.
- Set *VSTART < VSTOP*.

This will ensure smooth operation during positioning mode.

6.5. U-Turn Behavior

The process that is triggered when motion direction changes during motion, is described below, and applies to all ramp types.

U-Turn Behavior In case the motion direction is changed during motion in velocity mode (by direct assignment of *VMAX*) or in positioning mode (due to *XTARGET* reassignment), the following process is triggered:

- 1. Motion is directed to VACTUAL = 0.
 - i If *VSTOP* is used $(\neq 0)$, motion terminates at *VSTOP*.
- 2. A standstill phase of *TZEROWAIT* clock cycles (register 0x7B) occurs.
 - It is recommended to assign *TZEROWAIT* > 0, if *VSTOP* and/or a trapezoidal ramp type are used, because motor oscillations can occur that must peter out.
- 3. Motion continues to the actual *XTARGET* (positioning mode), or to the newly assigned *VMAX* (velocity mode).
 - i If *VSTART* is used (\neq 0), motion begins with *VSTART* if *TZEROWAIT* > 0.

After reaching *VSTOP*, *TZEROWAIT* clock cycles are waited until motion continues to peter out motor oscillations.

Example: U-Turn for sixPoint Ramps

•→ Turn page for information on U-Turn for S-shaped ramps.

Example: U-Turn for S-shaped Ramps

When VACTUAL = 0 is reached, motion immediately continues. In most S-shaped ramp applications that do not use *VSTOP*, a standstill phase is not required. If ASTART > 0 and/or *DFINAL* > 0, these parameters are also used during U-Turn.

Figure 29: Example for U-Turn Behavior of S-shaped Ramp

6.5.1. Continuous Velocity Motion Profile for S-shaped Ramps There is one exception to the above explained U-Turn process: In case **BOW2** equals **BOW4**, the S-shaped ramp is not stopped at VACTUAL = 0. While passing VACTUAL = 0, motion acceleration does not equal 0. Thus, the fastest possible U-Turn behavior for this ramp is created.

In the figure below, this velocity ramp behavior is depicted as bold black line, whereas the velocity ramp behavior of the process explained above is depicted gray line:

Figure 30: Direct transition via VACTUAL=0 for S-shaped Ramps

6.6. Internal Ramp Generator Units

This section provides information about the arithmetical units of the ramp parameters.

6.6.1. Clock Frequency	All parameter units are real arithmetical units. Therefore, it is necessary to set the <i>CLK_FREQ</i> register 0x31 to proper [Hz] value, which is defined by the external clock frequency f_{CLK} . Any value between $f_{CLK} = 4.2$ MHz and 32 MHz can be selected. Default configuration is 16 MHz.
6.6.2. Velocity Value Units	Velocity values are always defined as pulses per second [pps]. VACTUAL is given as a 32-bit signed value with no decimal places. The unsigned velocity values VSTART, VSTOP, and VBREAK consist of 23 digits and 8 decimal places. VMAX is a signed value with 24 digits and 8 decimal places.

The maximum velocity VMAX is restricted as follows:

Velocity mode:	$ VMAX \leq 1/2$ pulse \cdot fclk
Positioning mode:	$ VMAX \leq \frac{1}{4} \text{ pulse} \cdot f_{CLK}$

NOTE:

→ In case VACTUAL exceeds this limit INCORRECT step pulses at STPOUT output occur and/or positioning is not executed properly.

Furthermore, VMAX have to be the highest nominal value of all velocity values:

|VMAX| > max(VSTART;VSTOP;VBREAK)

6.6.3. Acceleration Value Units The unsigned values *AMAX*, *DMAX*, *ASTART*, *DFINAL*, and *DSTOP* consist of 22 digits and 2 decimal places.

AACTUAL shows a 32-bit nondecimal signed value. Acceleration and deceleration units are defined per default as pulses per second² [pps²].

If higher acceleration/deceleration values are required for short and steep ramps, do as follows:

Action:

Set direct_acc_val_en =1 (GENERAL_CONF register 0x00).

Result:

The parameters are defined as velocity value change per clock cycle with 24-bit unsigned decimal places (MSB = 2^{-14}). The values are calculated as follows:

 $AMAX [pps²] = AMAX / 2³⁷ \cdot f_{CLK²}$ $DMAX [pps²] = DMAX / 2³⁷ \cdot f_{CLK²}$ $ASTART [pps²] = ASTART / 2³⁷ \cdot f_{CLK²}$ $DFINAL [pps²] = DFINAL / 2³⁷ \cdot f_{CLK²}$ $DSTOP [pps²] = DSTOP / 2³⁷ \cdot f_{CLK²}$

The maximum acceleration or deceleration values are as follows:

max(AMAX;DMAX;ASTART;DFINAL;DSTOP) [pps²] < VMAX · f_{CLK} / 1024

In case *direct_acc_val_en* = 1, the maximum value is also limited to:

 $max(AMAX;DMAX;ASTART;DFINAL;DSTOP) \le 2^{20}$

• → Continued on next page.

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

Read entire documentation; especially the "Supplemental Directives" on page 160.

6.6.4. Bow Value Units

Bow values BOW1...BOW4:

Bow values are unsigned 24-bit values without decimal places. They are defined per default as pulses per second³ [pps³].

In case higher bow values are required for short and steep ramps, do as follows:

Action:

Set direct_bow_val_en =1 (GENERAL_CONF register 0x00)

Result:

The parameters are defined as acceleration value change per clock cycle with 24-bit unsigned decimal places with the MSB defined as 2⁻²⁹.

The particular bow values BOW1, BOW2, BOW3, BOW4 are calculated as follows:

BOWx [pps³] = $BOWx / 2^{53} \cdot f_{CLK^3}$

The maximum bow are as follows:

max(BOW1...4) [pps²] ≤ max(AMAX;DMAX) [pps²] · f_{CLK} / 1024

In case *direct_bow_val_en* = 1, the maximum value is also limited to:

 $\max(BOW1...4) \le 2^{20}$

6.6.5. Overview of Minimum and Maximum Values:

Minimum and Maximum Values (Frequency Mode and in general)					
Value Classes	Velocity	Acceleration	Bow	Clock	
Affected Registers	VMAX, VSTART, VSTOP, VBREAK	AMAX, DMAX, ASTART, DFINAL	BOW1, BOW2, BOW3, BOW4	CLK_FREQ (f _{CLK})	
Minimum Nominal Value	3.906 mpps	0.25 mpps ²	1 mpps ³	4.194 MHz

Read entire documentation; especially the "Supplemental Directives" on page $\underline{160}$.

7. External Step Control and Electronic Gearing

Steps can also be generated by external steps that are manipulated internally by an electronic gearing process. In the following chapter, steps generation by external control and electronic gearing is presented.

Pins for External Step Control			
Pin Names	Туре	Remarks	
STPIN	Input	Step input signal.	
DIRIN	Input	Direction input signal.	

Table 20: Pins used for External Step Control

Registers used for external Step Control				
Register Name	Register /	Address	Remarks	
GENERAL_CONF	0x00	RW	Bits 9:6, 26.	
GEAR_RATIO	0x12	RW	Electronic gearing factor; signed; 32 bits=8+24 (8-bit digits, 24-bit decimal places).	

Table 21: Registers used for External Step Control

Enabling External Step Control

In order to synchronize with other motion controllers, TMC4330A offers a step direction input interface at the STPIN and DIRIN input pins.

i Three options are available. In case one of these options is selected, the internal step generator is disabled.

OPTION 1: HIGH ACTIVE EXTERNAL STEPS

Action:

Set sdin_mode = b'01 (GENERAL_CONF register 0x00).

Result:

As soon as the STPIN input signal switches to high state the control unit recognizes an external step.

OPTION 2: LOW ACTIVE EXTERNAL STEPS

Action:

Set sdin_mode = b'10 (GENERAL_CONF register 0x00).

Result:

As soon as the STPIN input signal switches to low state the control unit recognizes an external step.

OPTION 3: TOGGLING EXTERNAL STEPS

Action:

Set sdin_mode = b'11 (GENERAL_CONF register 0x00).

Result:

As soon as the STPIN input signal switches to low or high state the control unit recognizes an external step.

• → Continued on next page.

Selecting the	
Input Direction	
Polarity	

7.1.

Description of

Electronic

Gearing

DIRIN polarity can be assigned. Per default, the negative direction is indicated by DIRIN = 0.

In order to change this polarity:

Action:

Set pol_dir_in = 1 (GENERAL_CONF register 0x00).

Result:

A negative input direction is assigned by DIRIN = 1.

If an external step is not congruent with an internal step, the *GEAR_RATIO* register 0x12 must be set accordingly. This signed parameter consists of eight bit digits and 24 bits decimal places.

With every external step the assigned *GEAR_RATIO* value is added to an internal accumulation register. As soon as an overflow occurs, an internal step is generated and the remainder will be kept for the next external step. Any absolute gearing value between 2^{-24} and 127 is possible.

NOTE:

- \rightarrow Gearing ratios beyond 1 generate a burst of steps at the STPOUT pin.
- → A negative gearing factor GEAR_RATIO < 0 inverts the interpretation of the input direction which is determined by DIRIN and pol_dir_in.

7.2. Indirect External Control It is possible to use the internal ramp generator in combination with the external S/D interface.

In this case, the external step impulses transferred via STPIN and DIRIN cannot influence the internal *XACTUAL* counter directly. Instead, the *XTARGET* register is altered by 1 or -1 with every *GEAR_RATIO* accumulation register overflow.

NOTE:

- → Whether XTARGET is increased or decreased is determined similarly to the direct electronic gearing control. The accumulation register overflow direction indicates the target alteration. Respectively, the accumulation direction is determined by the GEAR_RATIO sign, by pol_dir_in, and by DIRIN.
- \rightarrow Consecutive input steps must occur with a distance of minimum 64 clock cycles.
- i This feature allows a synchronized motion of different positioning ramps for different TMC4330A chips with differently configured ramps.

In order to select indirect external control, do as follows:

Action:

- > Set *sdin_mode* \neq b'00 according to the required external control option.
- Set sd_indirect_control = 1 (GENERAL_CONF register 0x00).

Result:

As soon as an external step is generated, *XTARGET* is increased or decreased, according to the accumulation direction.

7.3. Switching from External to Internal Control In some cases, it is useful to switch from external to internal ramp generation during motion.

TMC4330A supports a smooth transfer from direct external control to an internal ramp. The only parameter you need to know and apply is the current velocity when the switching occurs. In more detail, this means that when the external control is switched off, *VSTART* takes over the definition of the actual velocity value. The ramp direction is then selected automatically. The time step of the last internal step is also taken into account in order to provide a smooth transition from external to internal ramp control.

In order to select automatic switching from external to internal control, do as follows:

PRECONDITION (EXTERNAL DIRECT CONTROL IS ACTIVE):

Action:

- Set sdin_mode ≠ b'00 (GENERAL_CONF register 0x00).
- Set sd_indirect_control = 0 (GENERAL_CONF register 0x00).
- > Set ASTART = 0 (register 0x2A).

PROCEED WITH:

Action:

- Set automatic_direct_sdin_switch_off = 1 (GENERAL_CONF register 0x00) once before switching to internal control.
- > Continually adapt *VSTART* register 0x25 according to the actual velocity of the TMC4330A that must be calculated in the μ C.
- > If switching must be prompted, set *sdin_mode* = b'00.

Result:

The internal ramp velocity is started with the value of *VSTART*, and the direction is set automatically on the basis of the external steps that have occurred before.

Smooth Switching for S-shaped Ramps In order to also support a smooth S-shaped ramp transition - when the external step control is switched off - the starting acceleration value can also be set separately at *ASTART* register 0x2A.

i In contrast to the automatic direction assignment, the sign of *ASTART* must be set manually.

In order to select automatic switching from external to internal control with a starting acceleration value, do as follows:

PRECONDITION (EXTERNAL DIRECT CONTROL IS ACTIVE):

Action:

- Set sdin_mode ≠ b'00 (GENERAL_CONF register 0x00).
- Set sd_indirect_control = 0 (GENERAL_CONF register 0x00).

PROCEED WITH:

Action:

- Set automatic_direct_sdin_switch_off = 1 once before switching to internal control.
- > Continually adapt *VSTART* register 0x25 according to the actual velocity of the TMC4330A that must be calculated in the μ C.
- > Continually adapt ASTART according to the actual acceleration (unsigned value) of the TMC4330A that must be calculated in the μ C.
- > Continually set ASTART(31) = 0 or 1 according to the acceleration direction.
- > If switching must be prompted, set *sdin_mode* = b'00.

Result:

The internal ramp velocity is started with the value of *VSTART*, and the direction is set automatically on the basis of the external steps that have occurred before. The internal acceleration value is set to: +ASTART if ASTART(31) = 0 or -ASTART if ASTART(31) = 1.

8. Reference Switches

The reference input signals of the TMC4330A function partly as safety features. The TMC4330A provides a range of reference switch settings that can be configured for many different applications. The TMC4330A offers two hardware switches (STOPL, STOPR) and two additional virtual stop switches (*VIRT_STOP_LEFT, VIRT_STOP_RIGHT*). A home reference switch HOME_REF is also available.

Pins used for Reference Switches			
Pin Names	Туре	Remarks	
STOPL	Input	Left reference switch.	
STOPR	Input	Right reference switch.	
HOME_REF	Input	Home switch.	
TARGET_REACHED	Output	Reference switch to indicate XACTUAL=XTARGET.	

Table 22: Pins used for Reference Switches

Dedicated Registers for Reference Switches				
Register Name	Registe	r Address	Remarks	
REFERENCE_CONF	0x01	RW	Configuration of interaction with reference pins.	
HOME_SAFETY_MARGIN	0x1E	RW	Region of uncertainty around X_HOME.	
DSTOP	0x2C	RW	Deceleration value if stop switches STOPL / STOPR or virtual stops are used with soft stop ramps. The deceleration value allows for an automatic linear stop ramp.	
POS_COMP	0x32	RW	Free configurable compare position; signed; 32 bits.	
VIRT_STOP_LEFT	0x33	RW	Virtual left stop that triggers a stop event at XACTUAL \leq VIRT_STOP_LEFT; signed; 32 bits.	
VIRT_STOP_RIGHT	0x34	RW	Virtual left stop that triggers a stop event at XACTUAL \geq VIRT_STOP_RIGHT; signed; 32 bits.	
X_HOME	0x35	RW	Home reference position; signed; 32 bits.	
X_LATCH	0x36	RW	Stores <i>XACTUAL</i> at different conditions; signed; 32 bits.	

Table 23: Dedicated Registers for Reference Switches

8.1. Hardware Switch Support

The TMC4330A offers two hardware switches that can be configured according to your design.

STOPL andThe hardware provides a left and a right stop in order to stop the drive immediatelySTOPRin case one of them is triggered. Therefore, pin 12 and pin 14 of the motion controller
must be used.

NOTE:

 \rightarrow Both switches must be enabled before motion occurs.

In order to enable STOPL correctly, do as follows:

Action:

- Determine the active polarity voltage of STOPL and set *pol_stop_left* (*REFERENCE_CONF* register 0x01) accordingly.
- Set stop_left_en =1 (REFERENCE_CONF register 0x01).

Result:

The current velocity ramp stops in case the STOPL voltage level matches *pol_stop_left* and VACTUAL < 0.

In order to enable STOPR correctly, do as follows:

Action:

- Determine the active polarity voltage of STOPR and set *pol_stop_right* (*REFERENCE_CONF* register 0x01) accordingly.
- Set stop_right_en =1 (REFERENCE_CONF register 0x01).

Result:

The current velocity ramp stops in case STOPR voltage level matches pol_stop_right and VACTUAL > 0.

8.1.1. Stop Slope Configuration for Hard or Linear Stop Slopes The stop slope can be configured for hard or linear stop slopes. Per default, hard stops are selected.

If hard stops are required, do as follows:

OPTION 1: HARD STOP SLOPES

Action:

Set soft_stop_en =0 (REFERENCE_CONF register 0x01).

Result:

If one of the stop switches is active and enabled, the velocity ramp is set immediately to VACTUAL = 0.

OPTION 2: LINEAR STOP SLOPES

If linear stop ramps are required:

Action:

- Set proper DSTOP > max(DMAX; DFINAL) (register 0x2C).
- > Set soft_stop_en =1 (REFERENCE_CONF register 0x01).

Result:

If one of the stop switches is active and enabled, the velocity ramp is stopped with a linear deceleration slope until VACTUAL = 0 is reached. In this case the deceleration factor is determined by *DSTOP*. *VSTOP* is not considered during the stop deceleration slope.

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: www.trinamic.com .

8.1.2. How Active Stops are indicated and reset to Free Motion When an enabled stop switch becomes active the related status flag is set in the *STATUS* flags register 0x0F. The flag remains active as long as the stop switch remains active.

The particular event is also released in the *EVENTS* register 0x0E, which remains active until the event bit is reset manually. When VACTUAL = 0 is reached after the stop event no motion toward this particular direction is possible.

In order to move into the locked direction, the following is required:

PRECONDITION 1:

The particular stop switch is NOT active anymore.

<u>AND/OR</u>

PRECONDITION 2:

The stop switch is disabled (*stop_left/right_en* = 0).

Action:

> Set back the active event by reading out the *EVENTS* register 0x0E.

i See information about clearing events provided in section 5.1, page 21.

Result:

The active stop event is reset to free motion into the locked direction.

8.1.3. How to latch Internal Position on Switch Events It is possible to select four different events to store the current internal position *XACTUAL* in the register *X_LATCH*. The table below show which transition of the reference signal leads to the *X_LATCH*.

The table below show which transition of the reference signal leads to the X_LATCH transfer. For each transition process the specified reference configurations in the *REFERENCE_CONF* register 0x01 must be set accordingly.

Reference Configuration	pol_stop_left=0	<pre>pol_stop_left=1</pre>	pol_stop_right=0	<pre>pol_stop_right=1</pre>
<pre>latch_x_on_inactive_l=1</pre>	STOPL=0 \rightarrow 1	STOPL=1 \rightarrow 0		
<pre>latch_x_on_active_l=1</pre>	STOPL=1 \rightarrow 0	STOPL=0 \rightarrow 1		
<pre>latch_x_on_inactive_r=1</pre>			STOPR=0 \rightarrow 1	STOPR = $1 \rightarrow 0$
<pre>latch_x_on_active_r=1</pre>			STOPR=1 \rightarrow 0	STOPR = $0 \rightarrow 1$

Table 24: Reference Configuration and Corresponding Transition of particular Reference Switch

Interchange the Reference Switches without Physical Reconnection

If you need to change the directions of the reference switches, do as follows:

Action:

Set invert_stop_direction=1 (REFERENCE_CONF register 0x01).

Result:

STOPL is now the right reference switch and STOPR is now the left reference switch. Consequently, all configuration parameters for STOPL become valid for STOPR and vice versa.

@ 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: $\underline{www.trinamic.com}$.

8.2. Virtual Stop Switches

TMC4330A provides additional virtual limits; which trigger stop slopes in case the specific virtual stop switch microstep position is reached. Virtual stop positions are assigned using the *VIRTUAL_STOP_LEFT* register 0x33 and *VIRTUAL_STOP_RIGHT* register 0x34. In this section, configuration details for virtual stop switches are provided for various design-in purposes.

NOTE:

8.2.1.

8.2.2.

Slope

Virtual Stop

Configuration

Enabling Virtual

Stop Switches

→ Virtual stop switches must be enabled in the same manner as nonvirtual reference switches. Hitting a virtual limit switch - by receiving the assigned position - triggers the same process as hitting STOPL or STOPR.

In order to enable left virtual stop correctly, do as follows:

Action:

- > Set *VIRTUAL_STOP_LEFT* register 0x33 according to left stop position.
- > Set *virtual_left_limit_en* =1 (*REFERENCE_CONF* register 0x01).

Result:

The actual velocity ramp stops in case $XACTUAL \leq VIRT_STOP_LEFT$. The ramp is stopped according to the selected ramp type.

In order to enable right virtual stop correctly, do as follows:

Action:

- > Set *VIRTUAL_STOP_RIGHT* register 0x34 according to right stop position.
- Set virtual_right_limit_en =1 (REFERENCE_CONF register 0x01).

Result:

The actual velocity ramp stops in case $XACTUAL \ge VIRT_STOP_RIGHT$. The ramp is stopped according to the selected ramp type.

The virtual stop slope can also be configured for hard or linear stop slopes.

If virtual hard stops are required, do as follows:

Action:

Set virt_stop_mode = b'01 (REFERENCE_CONF register 0x01).

Result:

If one of the virtual stop switches is active and enabled, the velocity ramp will be set immediately to VACTUAL = 0.

If virtual linear stop ramps are required, do as follows:

Action:

- Set proper DSTOP > max(DMAX; DFINAL) (register 0x2C).
- Set virt_stop_mode = b'10 (REFERENCE_CONF register 0x01).

Result:

If one of the virtual stop switches is active and enabled, the velocity ramp is stopped with a linear deceleration slope until VACTUAL = 0 is reached. In this case the deceleration factor is determined by *DSTOP*. *VSTOP* is not considered during the stop deceleration slope.

● → Continued on next page.

8.2.3. How Active Virtual Stops are indicated and reset to Free Motion At the same time when an enabled virtual stop switch becomes active the related status flag is activated in the STATUS flags register 0x0F. The flag remains active as long as the stop switch remains active.

The particular event is also released in the *EVENTS* register 0x0E, which remains active until the event is reset manually. When VACTUAL = 0 is reached after the stop event no motion in the particular direction is possible.

In order to move into the locked direction, the following is required:

PRECONDITION 1:

The particular stop switch is NOT active anymore because the actual position does not exceed the specified limit.

AND/OR

PRECONDITION 2:

Virtual stop switch is disabled (*virtual_left/right_limit_en* = 0).

Action:

- > Set back active event by reading out *EVENTS* register 0x0E.
- i See information about clearing events provided in section 5.1, page 21.

Result:

The active virtual stop event bit is reset to free motion into the direction that was locked beforehand.

i invert_stop_direction has no influence on *VIRTUAL_STOP_LEFT* and *VIRTUAL_STOP_RIGHT*.

8.3. Home Reference Configuration

In this section home reference switch handling is explained with information about home tracking modes, possible home event configurations and home event monitoring. For monitoring, the switch reference input HOME_REF is provided.

Switch	Perform the following to initiate the homing process:				
Reference Input HOME_REF	 Action: Assign a ramp according to your needs for the homing process. Enable the home tracking mode with <i>start_home_tracking</i> = 1 (<i>REFERENCE_CONF</i> register 0x01). Set the correct <i>home_event</i> (<i>REFERENCE_CONF</i> register 0x01) for the HOME_REF input pin (see table below). Start the ramp towards the home switch HOME_REF. 				
	 Result: When the next home event is recognized, <i>XACTUAL</i> is latched to <i>X_HOME</i>. At the same time, the <i>start_home_tracking</i> switch is disabled automatically in case <i>XLATCH_DONE</i> event is cleared. The <i>XLATCH_DONE</i> event is released in the events register 0x0E. This event can be used for an interrupt routine for the homing process to avoid polling. 				
	 i If an incremental encoder is used to monitor the motion, the N channel can be used to fine-tune the homing position (<i>home_event</i> = b'0000). After performing the homing process - as explained before - the N channel events can be used to obtain a more precise home position. i X_HOME can be overwritten manually. 				
8.3.1.	Nine different home events are possible.				
Home Event Selection	i Except for the <i>home_event</i> = b'0000, which uses the index channel of an incremental encoder, home events are related to the HOME_REF input pin:				

Home Event Selection Table X HOME home event Description (direction: negative / positive) $HOME_REF = 0$ indicates negative direction in HOME_REF b'0011 reference to X_HOME HOME_REF = 0 indicates positive direction in HOME_REF b'1100 reference to X_HOME HOME REF b′0110 X_HOME in center Λ HOME REF = 11 HOME REF b'0010 indicates home X_HOME on the left side 0 position HOME_REF b'0100 X_HOME on the right side ٥ 1 HOME_REF b'1001 X_HOME in center 0 HOME REF = 01 HOME_REF b'1011 indicates home X_HOME on the right side 0 position 1 HOME_REF b′1101 X HOME on the left side 0

incremental encoder, home events are related to the the HOME_REF input pin:

Table 25: Overview of different home_event Settings

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

Read entire documentation; especially the "Supplemental Directives" on page 160.

8.3.2.An error flag HOME_ERROR_F is permanently evaluated. This error flag indicatesHOME_REFwhether the current voltage level of the HOME_REF reference input is valid in regardMonitoringto X_HOME and the selected home_event.

In order to avoid false error flags (*HOME_ERROR_F*) because of mechanical inaccuracies, it is possible to setup an uncertainty home range around *X_HOME*. In this range, the error flag is not evaluated.

If you want to define an uncertainty area around X_HOME, do as follows:

Action:

Defining a Home

Range around

HOME REF

> Set *HOME_SAFETY_MARGIN* register 0x1E according to the required range [ustep].

Result:

The homing uncertainties – related to the application environment – are considered for the ongoing motion. The error flag is NOT evaluated in the following range:

 $X_HOME - HOME_SAFETY_MARGIN \le XACTUAL \le X_HOME + HOME_SAFETY_MARGIN$

NOTE:

- → It is recommended to assign to a higher range value for HOME_SAFETY_MARGIN in which the HOME_REF level is active for the home_events b'0110, b'0010, b'0100, b'1001, b'1011, and b'1101. It avoids false positive HOME_ERROR_Flags.
- → After homing with the index channel (home_event = b'0000) for a precise assignment of X_HOME the correct home_event has to be assigned in order to activate the generation of HOME_ERROR_Flags. Note that home_event = b'0000 results in HOME_ERROR_Flag=0 permanently.
- → The following examples illustrate the points at which the error flag is release based on the selected home_event here for home_event = b'0011 (*), b'1100 (***), b'0110 (***), b'0010 (***), b'0100 (***), b'1001 (****), b'1011 (****), and b'1101 (****).

Figure 31: HOME_REF Monitoring and HOME_ERROR_FLAG

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

STOPL and STOPR inputs can also be used as HOME_REF inputs.

8.3.3. Homing with STOPL or STOPR

OPTION 1: STOPL IS THE HOME SWITCH

Action:

> Set stop_left_is_home = 1 (REFERENCE_CONF register 0x01).

Result:

The stop event at STOPL only occurs when the home range is crossed after STOPL becomes active. The home range is given by *X_HOME* and *HOME_SAFETY_MARGIN*.

OPTION 2: STOPR IS HOME SWITCH

Action:

Set stop_right_is_home = 1 (REFERENCE_CONF register 0x01).

Result:

The stop event at STOPR only occurs when the home region is crossed after STOPR becomes active. The home region is given by *X_HOME* and *HOME_SAFETY_MARGIN*.

(3)

8.4. Target Reached / Position Comparison

In this section, TARGET_REACHED output pin configuration options are explained, as well as different ways how to compare different values internally.

Target ReachedTARGET_REACHED output pin forwards the TARGET_REACHED_Flag. As soon asOutput PinXACTUAL equals XTARGET, TARGET_REACHED is active. Per default, the
TARGET_REACHED pin is high active.

To change the TARGET_REACHED output polarity, do the following:

Action:

Set invert_pol_target_reached = 1 (bit16 of the GENERAL_CONF register 0x00).

Result:

TARGET_REACHED pin is low active.

8.4.1. Connecting several Target-reached Pins

TARGET_REACHED pins can also be configured for a shared signal line in the same way as several INTR pins can configured for one interrupt signal transfer (see section 5.4. (page 23).

To use a Wired-Or or Wired-And behavior, the below described order of action must be executed:

Action:

Step 1: Set intr_tr_pu_pd_en = 1 (GENERAL_CONF register 0x00).

OPTION 1: WIRED-OR

Action:

Step 2: Set tr_as_wired_and = 0 (GENERAL_CONF register 0x00).

Result:

The TARGET_REACHED pin works efficiently as Wired-Or (default configuration).

i In case TARGET_REACHED pin is inactive, the pin drive has a weak inactive polarity output. During active state, the output is driven strongly. Consequently, if one of the connected pins is activated, the whole line is set to active polarity.

OPTION 2: WIRED-AND

Action:

Step 2: Set tr_as_wired_and = 1 (GENERAL_CONF register 0x00).

Result:

As long as the target position is not reached, the TARGET_REACHED pin has a strong inactive polarity output. During active state, the pin drive has a weak active polarity output. Consequently, the whole signal line is activated if all connected pins are forwarding the active polarity.

8.4.2. Use of TARGET_REACHED Output

Per default, TARGET_REACHED pin forwards the *TARGET_REACHED_F* (A) that signifies *XACTUAL = XTARGET*. The pin can also be used to forward three other flags: *VELOCITY_REACHED_F* (A), *ENC_FAIL_F* (A), *POS_COMP_REACHED_F* (A).

NOTE:

 \rightarrow Only one option can be selected.

Four Options for The TARGET_REACHED output pin configuration switch is available at **TARGET_REACHED** *REFERENCE_CONF* register 0x01.

The available optons are as follows:

TARGET_REACHED Output Pin Configuration			
If pos_comp_output	Then TARGET_REACHED forwards		
b′00	TARGET_REACHED_Rag		
b′01	VELOCITY_REACHED_Flag		
b'10	ENC_FAIL_Flag		
b'11	POS_COMP_REACHED_Flag		

Table 26: TARGET_REACHED Output Pin Configuration

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany - Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

Read entire documentation; especially the "Supplemental Directives" on page <u>160</u>.

8.4.3. Position Comparison of Internal Values

TMC4330A provides several ways of comparing internal values. The position comparison process is permanently active and associated with one flag and one event. A positive comparison result can be forwarded through the INTR pin using the *POS_COMP_REACHED* event as interrupt source or by using the TARGET_REACHED pin as explained in section <u>8.4.2</u>, page <u>58</u>.

Basic Comparison Settings	How to compare the internal position with an arbitrary value:		
	 Action: Select a comparison value in the <i>POS_COMP</i> register 0x32. Select <i>pos_comp_source</i> = 0 (<i>REFERENCE_CONF</i> register 0x01). 		
	Result: <i>XACTUAL</i> is compared with <i>POS_COMP</i> . When <i>POS_COMP</i> equals <i>XACTUAL</i> the <i>POS_COMP_REACHED_F</i> ag becomes set and the <i>POS_COMP_REACHED</i> event becomes released.		
Select External	How to compare the external position with an arbitrary value:		
Position as Comparison Base	 Action: Select a comparison value in the <i>POS_COMP</i> register 0x32. Select <i>pos_comp_source</i> = 1 (<i>REFERENCE_CONF</i> register 0x01). 		
	Result: <i>ENC_POS</i> is compared with <i>POS_COMP</i> . When <i>POS_COMP</i> equals <i>ENC_POS</i> the <i>POS_COMP_REACHED_F</i> ag becomes set and the <i>POS_COMP_REACHED</i> event becomes released.		
	<u>NOTE:</u>		
	 → Because ENC_POS represents microsteps and not encoder steps, POS_COMP represents also microsteps for the comparison process with external positions. → In case ENC_POS moves past POS_COMP without assuming the same value as POS_COMP, the POS_COMP_REACHED event is not flagged but is nonetheless listed in the EVENTS register in order to indicate that it has traversed. 		
Comparison selection grid	In addition to comparing <i>XACTUAL</i> / <i>ENC_POS</i> with <i>POS_COMP</i> , it is also possible to conduct a comparison of one of both parameters with <i>X_HOME</i> or <i>X_LATCH</i> resp. <i>ENC_LATCH</i> . TMC4330A also allows comparison of the revolution counter <i>REV_CNT</i> against <i>POS_COMP</i> .		
SETTINGS ALERT	Only the selected combination generates the <i>POS_COMP_REACHED_</i> Flag and the corresponding event. Therefore, select <i>modified_pos_compare</i> in the <i>REFERENCE_CONF</i> register 0x01 as outlined in the table below:		
	Comparison Selection Grid		

Comparison Selection Grid			
	pos_comp_source		
modified_pos_compare	` O ′	`1'

Read entire documentation; especially the "Supplemental Directives" on page <u>160</u>.

8.5. Repetitive and Circular Motion

TMC4330A also provides options for auto-repetitive or auto-circular motion. In this section configuration options are explained.

8.5.1.	Per default, reaching XTARGET in positioning mode finishes a positioning ramp.
Repetitive Motion to	In order to continuously repeat the specified ramp, do as follows:
XTARGET	PRECONDITION:
	\sim Cat \mathcal{D} (\mathcal{D} \mathcal{D} \mathcal{D} \mathcal{D}) = 1 (\mathcal{D} a string reads in a string)

- > Set RAMPMODE(2) = 1 (positioning mode is active).
- > Configure a velocity ramp according to your requirements.

Action:

Set clr_pos_at_target =1 (REFERENCE_CONF register 0x01).

Result:

After *XTARGET* is reached (*TARGET_REACHED_F* ag is active), *XACTUAL* is set to 0. As long as *XTARGET* is NOT 0, the ramp restarts in order to reach *XTARGET* again. This leads to repetitious positioning ramps from 0 towards *XTARGET*.

NOTE:

→ It is possible to change XTARGET during repetitive motion. The reset of XACTUAL to 0 is always executed when XACTUAL equals XTARGET.

8.5.2. Activating Circular Motion If circular motion profiles are necessary for your application, TMC4330A offers a position limitation range of *XACTUAL* with an automatic overflow processing. As soon as *XACTUAL* reaches one of the two position range limits (positive / negative), the value of *XACTUAL* is set automatically to the value of the opposite range limit.

In order to activate circular motion, do as follows:

PRECONDITION:

If you want to activate circular motion, *XACTUAL* must be located within the defined range.

PROCEED WITH:

Action:

- > Set $X_RANGE \neq 0$ (register 0x36, only writing access!).
- Set circular_motion = 1 (REFERENCE_CONF register 0x01).

Result:

The positioning range of XACTUAL is limited to: $-X_RANGE \leq XACTUAL < X_RANGE$.

When *XACTUAL* reaches the most positive position ($X_RANGE - 1$) and the motion proceeds in positive direction; the next *XACTUAL* value is set to $-X_RANGE$. The same applies to proceeding in negative direction; where ($X_RANGE - 1$) is the position after $-X_RANGE$.

i During positioning mode, the motion direction will be dependent on the shortest path to the target position *XTARGET*. For example, if *XACTUAL* = 200, *X_RANGE* = 300 and *XTARGET* = −200, the positioning ramp will find its way across the overflow position (299 \rightarrow −300) (see Figure A) in *Table*_27 (page 63).

8.5.3. Uneven or Noninteger Microsteps per Revolution	Due to definition of the limitation range, one revolution only consists of an even number of microsteps. TMC4330A provides an option to overcome this limitation.
	• Some applications demand different requirements because a revolution consists of an uneven or noninteger number of microsteps.
Revolution	 TMC4330A allows a high adjustment range of microsteps by using: <i>CIRCULAR_DEC</i> register 0x7C.
	This value represents one digit and 31 decimal places as extension for the number of microsteps per one revolution.
	• A revolution is completed at overflow position. With every completed revolution the <i>CIRCULAR_DEC</i> value is added to an internal accumulation register. In case this register has an overflow, <i>XACTUAL</i> remains at its overflow position for one step.
	• On average, this leads to the following microsteps per revolution: Microsteps/rev = $(2 \cdot X_RANGE) + CIRCULAR_DEC / 2^{31}$.
Example 1: Uneven Number	One revolution consists of 601 microsteps. A definition of <i>X_RANGE</i> = 300 will only provide:
of Microsteps per Revolution	600 microsteps per revolution ($-300 \le XACTUAL \le 299$).
per Revolution	Whereas $X_RANGE = 301$ will result in:
	602 microsteps per revolution ($-301 \le XACTUAL \le 300$).
	By setting:
	$CIRCULAR_DEC = 0x80000000 (= 2^{31} / 2^{31} = 1).$
	An overflow is generated at the decimals accumulation register with every revolution. Therefore, <i>XACTUAL</i> prolongs the step at the overflow position for one step every time position overflow is overstepped. This results in a microstep count of 601 per revolution.
Example 2:	One revolution consists of 600.5 microsteps.
Noninteger	By setting:
Number of Microsteps per	$CIRCULAR_{DEC} = 0x40000000 (= 2^{30} / 2^{31} = 0.5).$
Revolution	Every second revolution an overflow is produced at the decimals' accumulation register. This leads to a microstep count of 600 every second revolution and 601 for the other half of the revolutions. On average, this leads to 600.5 microsteps per revolution.
Example 3:	One revolution consists of 601.25 microsteps.
Noninteger and	By setting:
uneven Number of Microsteps	$CIRCULAR_DEC = 0xA0000000 (= (2^{31} + 2^{29}) / 2^{31} = 1.25).$
per Revolution	With every revolution an overflow is produced at the decimals' accumulation register. Furthermore, at every fourth revolution an additional overflow occurs, which leads to another prolonged step. This leads to a microstep count of 601 for three of four revolutions and 602 for every fourth revolution. On average, this results in 601.25 microsteps per revolution.

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany - Terms of delivery and rights to technical change reserved. Download newest version at: $\underline{www.trinamic.com}$.

8.5.4. Release of the Revolution Counter By overstepping the position overflow, the internal REV_CNT register is increased by one revolution as soon as *XACTUAL* oversteps from (*X*_*RANGE* – 1) to -*X*_*RANGE* or is decreased by one revolution as soon as *XACTUAL* oversteps in the opposite direction.

The information about the number of revolutions can be obtained by reading out register 0x36, which by default is the X_LATCH register (read only).

In order to gain information on the number of revolutions:

Action:

Set circular_cnt_as_xlatch = 1 (GENERAL_CONF register 0x00).

Result:

Register 0x36 cease to display the X_LATCH value. Instead, the revolution counter *REV_CNT* can be read out at this register address.

<u>NOTE:</u>

 \rightarrow As soon as circular motion is inactive (circular_motion =0), REV_CNT is reset to 0.

8.6. Blocking Zones

8.6.1. Activating Blocking Zones during Circular Motion During circular motion, virtual stops can be used to set blocking zones. Positions inside these blocking zones are NOT dedicated for motion.

In order to activate the blocking zone, do as follows:

PRECONDITION:

Circular motion is activated (*circular_motion* = 0) and properly assigned ($X_RANGE \neq 0$).

PROCEED WITH:

Action:

- > Set VIRTUAL_STOP_LEFT register 0x33 as left limit for the blocking zone.
- > Set *VIRTUAL_STOP_RIGHT* register 0x34 as right limit for the blocking zone.
- > Enable both virtual limits as explained in section 8.2.1 (page 52).

Result:

The blocking zone reaches from *VIRTUAL_STOP_LEFT* to *VIRTUAL_STOP_RIGHT*. During positioning, the path from *XACTUAL* to *XTARGET* does not lead through the blocking zone; which can result in a longer path compared to the direct path through the blocking zone (see Figure B1 in Table <u>28</u>, page <u>63</u>).

However, the selected virtual stop deceleration ramp is initiated as soon as one of the limits is reached. This can result from the velocity mode or if the target *XTARGET* is located in the blocking zone.

● → Continued on next page.

Blocking Zone	The following positions are located within the blocking zone:
Definition	XACTUAL ≤ VIRT_STOP_LEFT

<u> AND / OR</u>

XACTUAL ≥ VIRT_STOP_RIGHT

NOTE:

- → In case VIRTUAL_STOP_LEFT < VIRTUAL_STOP_RIGHT, one of these conditions must be met in order to be located inside the blocking zone.
- → In case VIRTUAL_STOP_LEFT > VIRTUAL_STOP_RIGHT, both conditions must be met in order to be located inside the blocking zone.

8.6.2. Circular Motion with and without Blocking Zone The table below shows circular motion ($X_RANGE = 300$). The green arrow depicts the path which is chosen for positioning.

The shortest path selection is shown in Figure A and the consideration of blocking zones are shown in Figures B1 and B2.

Table 28: Circular motion (X_RANGE = 300)

Moving out of the Blocking Zone

When *XACTUAL* is located inside the blocking zone, it is possible to move out without redefining the blocking zone.

In order to get out of the blocking zone, do the following:

Action:

- > Activate positioning mode: RAMPMODE(2) = 1.
- > Configure velocity ramp according to your needs.
- > Clear virtual stop events by reading out *EVENTS* register 0x0E.
- > Set regular target position *XTARGET* outside of the blocking zone.

Result:

TMC4330A initiates a ramp with the shortest way to the target XTARGET.

i In order to match an incremental encoder in the same manner, select *circular_enc_en* =1 (*REFERENCE_CONF* register 0x01).

9. Ramp Timing and Synchronization

TMC4330A provides various options to initiate a new ramp. By default, every external register change is assigned immediately to the internal registers via an SPI input. With a proper start configuration, ramp sequences can be programmed without any intervention in between.

Synchronization Opportunities	Three levels of ramp start complexity are available. Predefined ramp starts are available, which are independent of SPI data transfer that are explained in the subsequent section 9.1 . (page 65).
	Two optional features can be configured that can either be used individually or combined, which are as follows:
Shadow Register Set	A complete shadow motion register set can be loaded into the actual motion registers in order to start the next ramp with an altered motion profile.
Target Position Pipeline	Different target positions can be predefined, which are then activated successively. This pipeline can be configured as cyclic; and/or it can also be utilized to sequence different parameters.
Masterless Synchronization	Also, another start state "busy" can be assigned in order to synchronize several motion controllers for one single start event without a master.

Dedicated Ramp Timing Pins		
Pin Names	Туре	Remarks
START	Input and Output	External start input to get a start signal or external start output to indicate an internal start event.

Table 29: Dedicated Ramp Timing Pins

Dedicated Ramp Timing Registers			
Register Name	Register Ac	dress	Remarks
START_CONF	0x02	RW	The configuration register of the synchronization unit.
START_OUT_ADD	0x11	RW	Additional active output length of external start signal.
START_DELAY	0x13	RW	Delay time between start triggers and start signal.
X_PIPE0 7	0x380x3F	RW	Target positions pipeline and/or parameter pipeline.
SH_REG012	0x400x4C	RW	Shadow register set

Table 30: Dedicated Ramp Timing Registers

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany - Terms of delivery and rights to technical change reserved. Download newest version at: $\underline{www.trinamic.com}$.

9.1. Basic Synchronization Settings

Usually, a ramp can be initiated internally or externally. Note that a start trigger is not the start signal itself but the transition slope to the active start state. After a defined delay, the internal start signal is generated.

9.1.1. Start Signal Trigger Selection	For ramp start configuration, consider the following steps:
	Action:
	Choose internal or external start trigger(s).
	Set the triggers according to the table below.

All triggers can be used separately or in combination. i

Start Trigger Configuration Table		
trigger_events = START_CONF(8:5)	Result	
b′0000	No start signal will be generated or processed further.	
b′xxx0	Set <i>trigger_events</i> (0) = 0 for internal start triggers only. The internally generated start signal is forwarded to the START pin that is assigned as output .	
b'xxx1	Set <i>trigger_events</i> (0) = 1 for an external start trigger. The START pin is assigned as input . For START input take filter settings into consideration. See chapter <u>4</u> , page <u>17</u> .	
b'xx1x	TARGET_REACHED event is assigned as start signal trigger for the ramp timer.	
b'x1xx	VELOCITY_REACHED event is assigned as start signal trigger for the ramp timer.	
b'1xxx	POSCOMP_REACHED event is assigned as start signal trigger for the ramp timer.	

Table 31: Start Trigger Configuration

9.1.2. Per default, every SPI datagram is processed immediately. By selecting one of the **User-specified** following enable switches, the assignment of SPI requests to registers XTARGET, VMAX, RAMP_MODE, and GEAR_RATIO is uncoupled from the SPI transfer. The value Impact **Configuration of** assignment is only processed after an internally generated start signal. Timing **Procedure**

In order to influence the impact of the start signal on internal parameter assignments, do the following:

Action:

> Choose between the following options as shown in the table below.

Start Enable Switch Configuration Table (All switches can be used separately or in combination.)		
<pre>start_en = START_CONF(4:0)</pre>	Result	
b′xxxx1	XTARGET is altered only after an internally generated start signal.	
b'xxx1x	VMAX is altered only after an internally generated start signal.	
b'xx1xx	RAMPMODE is altered only after an internally generated start signal.	
b'x1xxx	GEAR_RATIO is altered only after an internally generated start signal.	
b'1xxxx	Shadow register is assigned as active ramp parameters after an internally generated start signal. This is explained in more detail in section <u>9.2.</u> (page <u>70</u>).	

Table 32: Start Enable Switch Configuration

(3)

9.1.3. Delay Definition between Trigger and internally generated Start Signal	Per default, the trigger is closely followed by the internal start signal.
	In order to delay the generation of the internal start signal, do the following:
	Action:Set START_DELAY register 0x13 according to your specification.
	Result: When a start trigger is recognized, the internal start signal is generated after <i>START_DELAY</i> clock cycles.
Prioritizing	Per default, an external trigger is also delayed for the internal start signal generation.
External Input	In order to immediately prompt an external start, trigger to an internally generated start signal (regardless of a defined delay), do the following:
	<pre>Action: > Set immediate_start_in = 1 (START_CONF register 0x02).</pre>
	Result: When an external start trigger is recognized, the internal start signal is generated immediately, even if the internal start triggers have already initiated a timing process with an active delay.
START Pin Polarity	The START pin can be used either as input or as output pin. However, the active voltage level polarity of the START pin can be selected with one configuration switch in the <i>START_CONF</i> register 0x02.
	Per default, the voltage level transition from high to low triggers a start signal (START is an input), or START output indicates an active START event by switching from high to low level.
	In order to invert active START polarity, do as follows:
	<pre>Action: > Set pol_start_signal = 1 (START_CONF register 0x02).</pre>
	Result: The START pin is high active. The voltage level transition from low to high triggers a start signal (START is an input), or START output indicates an active START event by switching from low to high level.
9.1.4.	Per default, the active output voltage level of the START pin lasts one clock cycle.
Active START Pin Output Configuration	In order to extend this time span, do the following:
	<pre>Condition: > START pin is assigned as output: trigger_events(0) = 1.</pre>
	 Action: Set START_OUT_ADD register 0x11 according to your specification.
	Result: The active voltage level lasts (<i>START_OUT_ADD</i> + 1) clock cycles.

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany - Terms of delivery and rights to technical change reserved. Download newest version at: $\underline{www.trinamic.com}$.

9.1.5. Ramp Timing Examples

Ramp Timing Example 1

Process Description

(3)

The following three examples depict SPI datagrams, internal and external signal levels, corresponding velocity ramps, and additional explanations. SPI data is transferred internally at the end of each datagram.

In this example, the velocity value change is executed immediately.

- The new *XTARGET* value is assigned after TARGET_REACHED has been set and *START_DELAY* has elapsed.
- A new ramp does not start at the end of the second ramp because no new *XTARGET* value is assigned.
- START is an output.
- Internal start signal forwards with a step length of (*START_OUT_ADD* + 1) clock cycles.

This is how external devices can be synchronized:

Parameter Settings Timing Example 1					
Parameter	Setting				
RAMPMODE	b′101				
start_en	b′00001				
trigger_events	b′0010				
START_DELAY	>0				
START_OUT_ADD	>0				
pol_start_signal	1				

Table 33: Parameter Settings Timing Example 1

Figure 32: Ramp Timing Example 1

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

Ramp Timing Example 2

Process

63

Description

In this example, the velocity value and the ramp mode value change is executed after the first start signal.

- The new ramp mode becomes positioning mode with S-shaped ramps.
- The ramp then stops at target position *XTARGET* because of the ramp mode change.
- A further *XTARGET* change starts the ramp again.
- The ramp is initiated as soon as the start delay is completed, which was triggered by the first *TARGET_REACHED* event.
- The active START output signal lasts only one clock cycle.

Parameter Settings Timing Example 2				
Parameter	Setting			
RAMPMODE	b′001 → b′110			
start_en	b'00111			
trigger_events	b′0110			
START_DELAY	>0			
START_OUT_ADD	0			
pol_start_signal	0			

Table 34: Parameter Settings Timing Example 2

Figure 33: Ramp Timing Example 2

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

Ramp Timing Example 3

Process Description In this example external start signal triggers are prioritized by making use of $START_DELAY > 0$ and simultaneously setting *immediate_start_in* to 1.

- When *XACTUAL* equals *POSCOMP* the start timer is activated and the external start signal in between is ignored.
- The second start event is triggered by an external start signal. The *POSCOMP_REACHED* event is ignored.

The third start timer process is disrupted by the external START signal, which is forced to be executed immediately due to the setting of: *immediate_start_in* = 1.

Parameter Settings Timing Example 3				
Parameter	Setting			
RAMPMODE	b′000			
start_en	b′00010			
trigger_events	b'1001			
immediate_start_in	$0 \rightarrow 1$			
START_DELAY	>0			
pol_start_signal	1			

Table 35: Parameter Settings Timing Example 3

Figure 34: Ramp Timing Example 3

(3)

9.2. Shadow Register Settings

Some applications require a complete new ramp parameter set for a specific ramp situation / point in time. TMC4330A provides up to 14 shadow registers, which are loaded into the corresponding ramp parameter registers after an internal start signal is generated.

Enabling	In order to enable shadow registers, do as follows:						
Shadow Registers	 Action > Set <i>start_en</i>(4) = 1 and select one or more <i>trigger_events</i> (<i>START_CONF</i> register 0x02), see section <u>9.1.2</u> (page <u>65</u>). 						
	Result: With every successive internal start signal the shadow registers are loaded into the corresponding active ramp register.						
Enabling Cyclic Shadow	It is also possible to write back the current motion profile into the shadow motion registers to swap ramp motion profiles continually.						
Registers	In order to enable cyclic shadow registers, do as follows:						
	 Action > Set <i>start_en</i>(4) = 1 and select one or more <i>trigger_events</i> (<i>START_CONF</i> register 0x02) , see section 9.1.2 (page 65). > Set <i>cyclic_shadow_regs</i> = 1 (<i>START_CONF</i> register 0x02). 						
	Result: With every successive internal start signal the shadow registers are loaded into the corresponding active ramp register, whereas the active motion profile is loaded into						

• → Continued on next page.

the shadow registers.

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

9.2.1. Shadow Register Configuration Options

Option 1:

Shadow Default

Configuration

Four different optional shadow register assignments are available to match the shadow register set according to your selected ramp type. The available options are described on the next pages.

i Please note that the only difference between the configuration of shadow option 3 and 4 is that *VSTART* is exchanged by *VSTOP* for the transfer of the shadow registers.

If the whole ramp register is needed to set in a single level stack, do as follows:

Action:

- Set shadow_option = b'00 (START_CONF register 0x02).
- Set start_en(4) = 1 and select one or more trigger_events (START_CONF register 0x02)

Action:

- Default configuration: Set cyclic_shadow_regs = 0 (START_CONF register 0x02)
- Optional configuration: Set cyclic_shadow_regs = 1 (START_CONF register 0x02)

Result:

Every relevant motion parameter is altered at the next internal start signal by the corresponding shadow register parameter. In case cyclic shadow registers are used, the shadow register set is altered by the current motion profile set.

AREAS OF SPECIAL CONCERN

In case an S-shaped ramp type is selected and operation mode is switched from velocity to positioning mode (triggered by shadow register transfer), *SH_REG10* must not be equal to *BOW3*; to ensure safe operation mode switching.

● → On the following pages more options are explained. Pleae turn page.

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

Option 2: Double-stage Shadow Register Set for S-shaped Ramps In case S-shaped ramps are configured, a double-stage shadow register set can be used. Seven relevant motion parameters for S-shaped ramps are affected when the shadow registers become active.

In order to use a double-stage shadow register pipeline for S-shaped ramps, do as follows:

Action:

- Set shadow_option = b'01 (START_CONF register 0x02).
- Set start_en(4) = 1 and select one or more trigger_events (START_CONF register 0x02).

Action:

- Default configuration: Set cyclic_shadow_regs = 0 (START_CONF register 0x02).
- Optional configuration: Set cyclic_shadow_regs =1 (START_CONF register 0x02)

Result:

Seven motion parameters (*VMAX*, *AMAX*, *DMAX*, *BOW1...4*) are altered at the next internal start signal by the corresponding shadow register parameters (*SH_REG0...6*). Simultaneously, these shadow registers are exchanged with the parameters of the second shadow stage (*SH_REG7...13*).

In case cyclic shadow registers are used, the second shadow register set (*SH_REG7...13*) is altered by the current motion profile set, e.g. 0x28 (*AMAX*) is written back to 0x48 (*SH_REG8*).

The other ramp registers remain unaltered.

- → Description is continued on next page.

Option 3: Double-stage Shadow Register Set for Trapezoidal Ramps (*VSTART*) In case trapezoidal ramps are configured, a double-stage shadow register set can be used. Seven relevant motion parameters for trapezoidal ramps are affected when the shadow registers become active.

In order to use a double-stage shadow register pipeline for trapezoidal ramps, do as follows:

Action:

- Set shadow_option = b'10 (START_CONF register 0x02).
- Set start_en(4) = 1 and select one or more trigger_events (START_CONF register 0x02)

Action:

- Default configuration: Set cyclic_shadow_regs = 0 (START_CONF register 0x02).
- Optional configuration: Set cyclic_shadow_regs = 1 (START_CONF register 0x02).

Result:

Seven motion parameters (*VMAX*, *AMAX*, *DMAX*, *ASTART*, *DFINAL*, *VBREAK*, and *VSTART*) are altered at the next internal start signal by the corresponding shadow register parameters (*SH_REG0...6*). Simultaneously, these shadow registers are exchanged with the parameters of the second shadow stage (*SH_REG7...13*).

If cyclic shadow registers are used, the second shadow register set (*SH_REG7...13*) is altered by the current motion profile set, e.g. 0x27 (*VBREAK*) is written back to 0x4C (*SH_REG12*). The other ramp registers remain unaltered.

Option 4: Double-stage Shadow Register Set for Trapezoidal Ramps (*VSTOP*) In case trapezoidal ramps are configured, a double-stage shadow register set can be used. Seven relevant motion parameters for trapezoidal ramps are affected when the shadow registers become active.

In order to use a double-stage shadow register pipeline for trapezoidal ramps, do as follows:

Action:

- Set shadow_option = b'10 (START_CONF register 0x02).
- Set start_en(4) = 1 and select one or more trigger_events (START_CONF register 0x02)

Action:

- Default configuration: Set cyclic_shadow_regs = 0 (START_CONF register 0x02).
- Optional configuration: Set cyclic_shadow_regs = 1 (START_CONF register 0x02)

Result:

Seven motion parameters (*VMAX*, *AMAX*, *DMAX*, *ASTART*, *DFINAL*, *VBREAK*, and *VSTOP*) are altered at the next internal start signal by the corresponding shadow register parameters (*SH_REG0...6*). Simultaneously, these shadow registers are exchanged with the parameters of the second shadow stage (*SH_REG7...13*).

If cyclic shadow registers are used, the second shadow register set (*SH_REG7...13*) is altered by the current motion profile set, e.g. 0x26 (*VSTOP*) is written back to 0x4D (*SH_REG13*). The other ramp registers remain unaltered.

AREAS OF SPECIAL CONCERN	The values of ramp parameters, which are not selected by one of the four shadow options stay as originally configured, until the register is changed through an SPI write request. Also, the last stage of the shadow register pipeline retains the values until they are overwritten by an SPI write request if no cyclic shadow registers are selected.					
9.2.2. Delayed Shadow	Up to 15 internal start signals can be skipped before the shadow register transfer is executed.					
Transfer	In order to skip a defined number of internal start signals for the shadow transfer, do as follows:					
	 Action: > Set <i>shadow_option</i> according to your specification. > Set <i>start_en</i>(4) = 1 and select one or more <i>trigger_events</i> (<i>START_CONF</i> register 0x02) > <u>OPTTONAL CONFIGURATION</u>: Set cyclic_shadow_regs = 1. > Set <i>SHADOW_MISS_CNT</i> ≠ 0 (<i>START_CONF</i> register 0x02) according to the number of consecutive internal start signals that you specify to be ignored. Result: 					

The shadow register transfer is not executed with every internal start signal. Instead, the specified number of start signals is ignored until the shadow transfer is executed through the $(SHADOW_MISS_CNT+1)$ th start signal.

The following figure shows an example of how to make use of *SHADOW_MISS_CNT*, in which the shadow register transfer is illustrated by an internal signal sh_reg_transfer. The signal miss counter *CURRENT_MISS_CNT* can be read out at register address *START_CONF* (23:20):

Figure 39: SHADOW_MISS_CNT Parameter for several internal Start Signals

AREAS OF SPECIAL CONCERN Internal calculations to transfer the requested shadow BOW values into internal structures require at most (320 / f_{CLK}) [sec]. before any shadow register transfer is prompted, it is necessary to wait for the completion of all internal calculations for the shadow bow parameters.

In order to make this better understood the following example is provided for a double-stage shadow pipeline for S-shaped ramps:

PRECONDITION:

Shadow register transfer is activated ($start_en(1) = 1$ and one or more $trigger_events$ are selected) for S-shaped ramps ($shadow_option = b'01$)

Action

- > Set SH_REG0, SH_REG1, SH_REG2 (shadow register for VMAX, AMAX, DMAX).
- > Set *SH_REG3*, *SH_REG4*, *SH_REG5*, *SH_REG6* (shadow register for *BOW1...4*).
- > Ensure that no shadow register transfer occurs during the next 320 / fclk [s].

Result:

Shadow register transfer can be initiated after this time span.

Read entire documentation; especially the "Supplemental Directives" on page 160.

9.3. Pipelining Internal Parameters

TMC4330A provides a target pipeline for sequencing subordinate targets in order to easily arrange a complex target structure.

9.3.1.
Configuration
and Activation of
Target PipelineThe different target values must be assigned to the X_PIPE0...7 register. If the target
pipeline is enabled, a new assignment cycle is initiated as soon as an internal start
signal is generated; moving the values, as described, simultaneously:

PROCESS DESCRIPTION:

- A new *XTARGET* value is assigned that takes over the value of *X_PIPE0*.
- Every X_PIPEn register takes over the value of its successor:
 X_PIPEn = X_PIPEn+1

In order to activate the target pipeline, do as follows:

Action:

Set *pipeline_en* = b'0001 (*START_CONF* register 0x02).

Result:

Configuration of a cyclic Target

Pipeline

The above mentioned process description is executed with every new internal start signal prompting.

It is also possible to reassign the value of *XTARGET* to one (or more) of the pipeline registers $X_PIPE0...7$. Thereby, a cyclic target pipeline is created.

In order to enable a cyclic target pipeline, do as follows:

Action:

- Set pipeline_en = b'0001 (START_CONF register 0x02).
- Set XPIPE_REWRITE_REG in relation to the pipeline register where XTARGET have to written back (e.g. XPIPE_REWRITE_REG = b'00010000).

Result:

The above mentioned process description is executed with every new internal start signal prompting, and *XTARGET* is written back to the selected *X_PIPEx* register (e.g. *XPIPE_REWRITE_REG* = $0x10 \rightarrow XTARGET$ is written back to *X_PIPE4*).

The processes and actions described on the previous page, are depicted in the following figure. The assignment cycle that is initiated when an internal start signal occurs is depicted.

Figure 40: Target Pipeline with Configuration Options

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: www.trinamic.com .

9.3.2. Using the Pipeline for different internal Registers The TMC4330A pipeline (registers 0x38...0x3F) can be configured so that it splits up into maximal four segments. These segments can be used to feed the following internal parameters:

- XTARGET register 0x37
- POS_COMP register 0x32
- GEAR_RATIO register 0x12
- GENERAL_CONF 0x00

Consequently, these definite parameter value changes can be of importance concerning a continuous ramp motion and/or for reduced overhead synchronizing of several motion controllers.

The *POS_COMP* value can be used to initiate a start signal generation during motion. Therefore, it can be useful to pipeline this parameter in order to avoid dependence on SPI transfer speed.

For instance, if the distance between two *POS_COMP* values is very close and the current velocity is high enough that it misses the second value before the SPI transfer is finished, it is advisable to change *POS_COMP* immediately after the start signal.

The same is true for the *GEAR_RATIO* parameter, which defines the step response on incoming step impulses. Some applications require very quick gear factor alteration of the slave controller. Note that when the start signal is prompted directly, an immediate change can be very useful instead of altering the parameter by an SPI transfer.

Likewise, it can (but must not) be essential to change general configuration parameters at a defined point in time. A suitable application is a clearly defined transfer from a direct external control ($sd_in_mode = b'01$) to an internal ramp ($sd_in_mode = b'00$) or vice versa because in this case the master/slave relationship is interchanged.

The following pipeline options are available, which can be adjusted accordingly:

Pipeline Activation Options					
pipeline_en(3:0)	Description				
b'xxx1	Pipeline for XTARGET is enabled.				
b'xx1x	Pipeline for POS_COMP is enabled.				
b'x1xx	Pipeline for GEAR_RATIO is enabled.				
b'1xxx	Pipeline for GENERAL_CONF is enabled.				

Table 36: Pipeline Activation Options

Read entire documentation; especially the "<u>Supplemental Directives</u>" on page <u>160</u>.

9.3.3. Pipeline Mapping Overview

The *pipeline_en* parameter offers an open configuration for 16 different combinations of the pipeline segregation. As a result, the number of pipelines range from 0 to 4. This also has an impact on the pipeline depth. The possible options are as follows: eight stages, four stages, three stages and two stages.

In the "Pipeline Mapping" table below, the arrangement and depth of the pipeline is allocated according to the pipeline setup. The final register destination of pipeline registers are also depicted in order to illustrate from which pipeline registers ($X_PIPE0...7$) the final target registers (XTARGET, POS_COMP, GEAR_RATIO, GENERAL_CONF) are fed.

For example, if *POS_COMP* and *GEAR_RATIO* are chosen as parameters that are to be fed by the pipeline, two 4-stage pipelines are created. When an internal start signal is generated, *POS_COMP* assumes the value of *X_PIPE0*, whereas *X_PIPE4* feeds the *GEAR_RATIO* register.

But if *POS_COMP*, *GEAR_RATIO* and *XTARGET* are selected as parameter destinations, two 3-stage pipelines and one double-stage pipeline are created. When an internal start signal is generated, *XTARGET* assumes the value of *X_PIPE0*, *POS_COMP* assumes the value of *X_PIPE3*, whereas *X_PIPE6* feeds the *GEAR_RATIO* register.

Pipeline Mapping Table

More examples are described in detail on the following pages - *explaining some of the possible configurations and referencing examples* - listed in the Table below.

Pipeline

9.3.4. Cyclic Pipelining	 For all of the above shown configuration examples, it is possible to write back the current values of the selected registers (<i>XTARGET, POS_COMP, GEAR_RATIO</i> and/or <i>GENERAL_CONF</i>) to any of the pipeline registers of their assigned pipeline in order to generate cyclic pipelines. By selecting proper <i>XPIPE_REWRITE_REG</i>, the value that is written back to the pipeline register is selected automatically to fit the selected pipeline mapping.
9.3.5. Pipeline Examples	Below, several pipeline mapping examples with the corresponding configuration are shown.
Examples A+B:	Example A: Cyclic pipeline for <i>POS_COMP</i> , which has eight pipeline stages.
Using one	Example B: Cyclic pipeline for <i>GEAR_RATIO</i> , which has six pipeline stages.

9.4. Masterless Synchronization of Several Motion Controllers via START Pin

START pin can also be assigned as tristate input in order to synchronize several microcontroller masterless.

Activation of the Tristate START Pin	In this case START is assigned as tristate. A busy state is enabled. During this busy state, START is set as output with a strongly driven inactive polarity. If the internal start signal is generated – after the internal start timer is expired –START pin is assigned as input. Additionally, a weak output signal is forwarded at START. During this phase, the active start polarity is emitted.					
	In case the signal at START input is set to active polarity, because all members of the signal line are ready, START output remains active (strong driving strength) for <i>START_OUT_ADD</i> clock cycles.					
	Then, busy state is active again until the next start signal occurs.					
	In order to activate tristate START pin, do as follows:					
	<pre>Action: > Set busy_en = 1 (START_CONF register 0x02).</pre>					
	Result: The above mentioned process description is executed.					
START Pin Connection	In case START pin is connected with START pins of other TMC4330A devices, it is recommend that a series resistor (e.g. 220 Ω) is connected between the devices to limit the short circuit current flowing that can flow during the configuration phase					

when different voltage levels at the START pins of the different devices can occur.

NOTE:

 \rightarrow Avoid that short circuits last too long.

10. Controlled PWM Output

TMC4330A offers controlled PWM (Pulse Width Modulation) signals at STPOUT and DIROUT output pins. These PWM signals are generated by using the internal microstep look-up table (MSLUT) that can be adapted according to the design specifications, see section <u>10.3.</u>, page <u>85</u>. Additionally, these PWM vanlues can be scaled, depending on the internal velocity.

Dedicated PWM Output Pins					
Pin Names	Туре	Remarks			
STPOUT_PWMA	Output	PWM output for coil A.			
DIROUT_PWMB	Output	PWM output for coil B.			

Table 38: Dedicated PWM Output Pins

Dedicated PWM Output Registers					
Register Name	Register	Address	Remarks		
GENERAL_CONF	0x00	RW	Bit 21: <i>pwm_out_en.</i>		
CURENT_CONF	0x05	RW	<pre>pwm_scale_en = SCALE_CONF(8): PWM scale enable switch PWM_AMPL = SCALE_CONF(31:16): PWM amplitude at VACTUAL = 0.</pre>		
PWM_VMAX	0x17	RW	Second assignment to <i>VDRV_SCALE_LIMIT</i> : velocity at which the PWM scale parameter reaches 1 (maximum).		
PWM_FREQ	0x1F	RW	Number of clock cycles that forms one PWM period.		

Table 39: Dedicated PWM Output Registers

10.1.1.Per default, a positive internal velocity VACTUAL results in a forward motion through
internal MSLUT. Consequently, if VACTUAL < 0, the MSLUT values are developed
backwards.

In order to alter the default setting of the Internal Motion Direction, do as follows:

Action:

Set reverse_motor_dir =1 (bit28 of GENERAL_CONF register 0x00).

Result:

A positive internal velocity for *VACTUAL* results in a backward motion through the internal MSLUT.

10.1.2. The MSLUT is based on 256 micorsteps per fullstep. By altering the microstep resolution from 256 ($MSTEP_PER_FS = b'0000$) to a lower value, an internal step results in more than one MSLUT step. **Resolution** For instance, if the microstep resolution is set to 64 ($MSTEP_PER_FS = b'0010$),

For instance, if the microstep resolution is set to 64 ($MSTEP_PER_FS = b'0010$), MSCNT is either increased or decreased by 4 per each internal step. Accordingly, the passage through the MSLUT skips three current values per each internal step to match the new microstep resolution

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

Read entire documentation; especially the "Supplemental Directives" on page 160.

10.2. PWM Output Generation and Scaling Possibilities

Enable PWMThe STPOUT and DIROUT output pins generally forward internal generated microstepsOutputand motion direction. In contrast to that, it is possible to forward the internal MSLUTGenerationvalue as PWM output signals, which is dependent on the PWM frequency.

In order to generate PWM output, do as follows:

Action:

- > Set *PWM_FREQ* register 0x1F to the number of clock cycles for one PWM cycle.
- > Set pwm_out_en = 1 (GENERAL_CONF register 0x00).

Result:

Step/Dir output is disabled and PWM signals are forwarded via STPOUT_PWMA and DIROUT_PWMB. PWM frequency f_{PWM} is calculated by:

 $f_{PWM} = f_{CLK} / PWM_FREQ$

If PWM Voltage mode is selected:

NOTICE	Avoid unintended overheating to prevent motor damage during PWM mode!				
	• At lower velocity values PWM voltage scaling MUST be enabled.				
	This will ensure smooth operation during controlled PWM mode.				
PWM Duty Cycle Scaling	The duty cycle of both signals represent the sine (STPOUT) and cosine (DIROUT) values of the MSLUT. PWM scaling is adapted linearly, which depends on the internal ramp velocity. During Voltage PWM mode the scaling value at $VACTUAL = 0$ must be assigned, and also the velocity at which full scaling is reached.				
	In order to generate a scaled PWM output, do as follows:				
	 Action: Set <i>PWM_AMPL</i> (bit31:16 of register 0x05) as start PWM scaling value. Set <i>PWM_VMAX</i> register 0x17 to the internal ramp velocity [pps] at which full PWM scaling is reached. Set <i>pwm_scale</i> = 1 (bit8 of <i>SCALE_CONF</i> register 0x05). 				
	 PWM_SCALE is the actual scaling value. In case VACTUAL = 0, PWM_SCALE = (PWM_AMPL + 1) / 2¹⁷. 				
	 Whenever the absolute velocity value increases, the scale parameter also increases linearly until it reaches the maximum of PWM_SCALE = 0.5 at VACTUAL = PWM_VMAX. 				
	 i The minimum duty cycle is calculated by DUTY_MIN = (0.5 - PWM_SCALE). i The maximum duty cycle is calculated by DUTY_MAX = (0.5 + PWM_SCALE). i These values set the PWM duty cycle limits of any internal ramp velocity. 				

10.2.1. PWM Scale Example In *Figure* <u>54</u> below, the calculation of minimum/maximum PWM duty cycles with $PWM_AMPL = 32767$ is shown on the left side. Resulting duty cycles for different positions in the sine voltage curve are depicted on the right side. Calculated delays of minimum/maximum duty cycles are also shown.

Figure 49: Calculation of PWM Duty Cycles (PWM_AMPL)

10.3. Microstep Lookup Tables

TMC4330A provides a programmable lookup table (LUT) for storing the microstep values, which are the basis for the Voltage PWM output. Reprogramming the table from its predefined values to a motor-specific wave allows improved motor-reliant microstepping, particularly when using low-cost motors.

SETTINGS ALERT	TMC4330A-LA provides a default configuration of the internal microstep table MSLUT. The following explanations that are provided in this section only address engineers who use their own microstep table definition.
Programming Sine Wave Lookup Tables	The internal microstep wave table maps the microstep wave from 0° to 90° for 256 microsteps. It becomes automatically and symmetrically extended to 360° that consequently comprises 1024 microsteps. As a result, the microstep counter <i>MSCNT</i> ranges from 0 to 1023. Only a quarter of the wave is stored because this minimizes required memory and the amount of programmable data. Therefore, only 256 bits (<i>ofs</i> 00 to <i>ofs</i> 255) are required to store the quarter wave. These bits are mapped to eight 32-bit registers <i>MSLUT</i> [0] (register 0x70) to <i>MSLUT</i> [7] (register 0x77). When reading out the table the 10-bit microstep counter <i>MSCNT</i> addresses the fully extended wave table.
Sine Wave Table Structure	The MSLUT is an incremental table. This means that a certain order and succession is predefined at every next step based on the value before, using up to four flexible programmable segments within the quarter wave. The microstep limits of the four segments are controlled by the position registers X1, X2, and X3. Within these segments the next value of the MSLUT is calculated by adding the base

Within these segments the next value of the MSLUT is calculated by adding the base wave inclination Wx-1 (if ofs=0) or its successor Wx (if ofs=1). Because four segments are programmable, four base wave inclinations are available as basic increment value: 0, 1, 2, or 3. Thereby, even a negative wave inclination can be realized. This is shown in the next Figure where the values in last quarter segments are decreased or remain constant with every step towards *MSCNT*= 255.

Figure 50: LUT Programming Example

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

Actual Microstep	When the microstep sequencer advances within the microstep table (MSLUT), it
Calculations	calculates the actual microstep values for the motor coils with each microstep, and
	stores them to the register 0x7A , which comprises the values of both waves USTEPA
	and USTEPB. However, the incremental coding requires an absolute initialization -
	especially when the microstep table becomes modified. Therefore, USTEPA and
	USTEPB become re-initialized with the start values whenever MSCNT passes zero.

Characteristics of a 2-phase Stepper Motor Microstep Table As mentioned above, the MSLUT can be adapted to the motor requirements. In order to understand the nature of incremental coding of the microstep table, the characteristics of the microstep wave must be understood, as described in the list below:

Characteristics of a 2-phase motor microstep table:

- In principle, it is a reverse characteristic of the motor pole behavior.
- It is a polished wave to provide a smooth motor behavior. There are no jumps within the wave.
- The phase shift between both phases is exactly 90°, because this is the optimum angle of the poles inside the motor.
- The zero transition is at 0°. The curve is symmetrical within each quadrant (like a sine wave).
- The slope of the wave is normally positive, but due to torque variations it can also be (slightly) negative.
- But it must not be strictly monotonic as shown in the figure above.

Considering these facts, it becomes clear that the wave table can be compressed. The incremental coding applied to the TMC4330A uses a format that reduces the required information *- per entry of the 8-bit by a 256-entry wave table -* to slightly more than a single bit.

10.3.2. How to Program the Internal MSLUT

Principle of Incremental Encoding The principle of **incremental encoding** only stores the difference between the actual and the next table entry. In order to attain an absolute start value, the first entry is directly stored in *START_SIN*. Also, for ease-of-use, the first entry of the shifted table for the second motor phase is stored in *START_SIN_90_120*.

Based on these start values, every next table entry is calculated by adding an increment INC to the former value. This increment is the base wave inclination value Wx whenever its corresponding *ofs* bit is 1 or Wx - 1 if *ofs* = 0:

INC = Wx + (ofs - 1).

The base wave inclination can be set to four different values (0, 1, 2, 3), because it consists of two bits.

Because the wave inclination does not change dramatically, TMC4330A provides four wave inclination segments with the base wave inclinations (W0, W1, W2, and W3) and the segment borders (0, X1, X2, X3, and 255), as shown in the left quarter of the MSLUT diagram in *Figure* <u>48</u>, page <u>85</u>.

Wave Inclination Characteristics					
Wave Inclination Segment	Base Wave Inclination	Segment Ranges			
0	W0	0 X1			
1	W1	X1 X2			
2	W2	X2 X3			
3	W3	X3 255			

Table 40: Wave Inclination Characteristics of Internal MSLUT

Read entire documentation; especially the "Supplemental Directives" on page <u>160</u>.

• MAIN MANUAL •

10.3.3. Setup of MSLUT Segments

Base Wave Inclination and Border Values All base wave inclination values (each consists of two bits) as well as the border values (each consists of eight bit) between the segments are adjustable. They are assigned by *MSLUTSEL* register 0x78.

In order to change the base wave inclination values and the segment borders, do as follows:

Action:

- Define the segment borders X1, X2, and X3 and the base wave inclination values W0...W3 according to the requirements
- Set register MSLUTSEL(31:24) = X3.
- Set register MSLUTSEL(23:16) = X2.
- > Set register MSLUTSEL(15:8) = X1.
- Set register MSLUTSEL(7:6) = W3.
- Set register MSLUTSEL(5:4) = W2.
- Set register MSLUTSEL(3:2) = W1.
- Set register MSLUTSEL(1:0) = W0.

Result:

The segments and the base wave inclination values of the internal MSLUT are changed.

<u>NOTE:</u>

→ It is not mandatory to define four segments. For instance, if only two segments are required, set X2 and X3 to 255. Then, W0 is valid for segment 0 between MSCNT = 0 and MSCNT = X1, and W1 is valid between MSCNT = X1 and MSCNT = 255 (segment 1).

In order to change the *ofs* bits, do as follows:

Action:

- > Set MSLU7[0] register 0x70 = ofs31...ofs00.
- > Set MSLUT[1] register 0x71 = ofs63...ofs32.
- > Set MSLU7[2] register 0x72 = ofs95...ofs64.
- Set *MSLUT*[3] register 0x73 = *ofs*127...*ofs*96.
- Set *MSLUT*[4] register 0x74 = *ofs*159...*ofs*128.
- Set MSLU7[5] register 0x75 = ofs191...ofs160.
- > Set MSLUT[6] register 0x76 = ofs223...ofs192.
- > Set *MSLUT*[7] register 0x77 = *ofs*255...*ofs*224.

Result:

The *ofs* bits of the internal MSLUT are changed.

AREAS OF SPECIAL CONCERN

When modifying the wave:

Special care has to be applied in order to ensure a smooth and symmetrical zero transition whenever the quarter wave becomes expanded to a full wave.

Zero Crossing When adjusting the range:

The maximum resulting swing of the wave should be adjusted to a range of -248 to 248, in order to achieve the best possible resolution while at the same time leaving headroom for a hysteresis based chopper to add an offset.

10.3.4. Microstep Waves Start Values

Starting Microstep Values of MSLUT Configuration As both waves are shifted by 90° for two-phase stepper motors, the sine wave starts at 0° when MSCNT = 0. By comparison, the cosine wave begins at 90° when MSCNT = 256. At this starting points the microstep values are USTEPA = 0 for the sine wave and USTEPB = 247 for the cosine wave.

In contrast to the starting microstep positions that are fixed, these starting microstep values can be redefined if the default start values do not fit for the actual MSLUT.

In order to change the starting microstep values of the MSLUT, do as follows:

Action:

- Define the start values START_SIN and START_SIN90_120 according to the requirements.
- Set register 0x7E (7:0) = START_SIN

Set register 0x7E (23:16) = START_SIN90_120

Result:

The starting values for both waves are adapted to MSLUT.

10.3.5. Default MSLUT

Base Wave Inclinations The default sine wave table in TMC drivers uses one segment with a base inclination of 2 and one segment with a base inclination of 1 (see default value of the *MSLUTSEL* register 0x78 = 0xFFFF8056).

The segment border X1 is located at MSCNT = 128. The base wave inclinations are

W0 = b'10 (=2) and W1 = b'01 (=1).

As a result, between *MSCNT* = 0 and 128, the increment value INC is either

1 (if ofs = 0) or 2 (if ofs = 1).

And between MSCNT = 128 and 255, the increment value INC is either

0 (if ofs = 0) or 1 (if ofs = 1).

This reflects the stronger rise in the first segment of the MSLUT in contrast to the second segment. The maximum value is

START_SIN90_120 = 247.

10.3.6. Explanatory Notes for Base Wave Inclinations

Definition of Segments 0,1,2,3

Standard Sine

prior to SETUP of MSLUT

Wave Setup Considerations In the following example four segments are defined.

Each segment has a different base wave inclination to illustrate each possible entry:

Segment 0: W0 = 3 which means that the increment value is +2 or +3. Segment 1: W0 = 2 which means that the increment value is +1 or +2. Segment 2: W0 = 1 which means that the increment value is 0 or +1. Segment 3: W0 = 0 which means that the increment value is -1 or 0.

- i In addition to the MSLUT curve (black line), which is defined by the given *ofs* bits, all four segments show upper limits (red line); in case all *ofs* bits in the particular segments are set to 1.
- i The green line shows the lower limit in case all *ofs* bits in the particular segments are set to 0.

Figure 51: MSLUT Curve with all possible Base Wave Inclinations (highest Inclination first)

In order to set up a standard sine wave table for the MSLUT, the following considerations have to be taken into account:

PRECONSIDERATIONS:

- The microstep table for the standard sine wave begins with eight entries (0 to 7) {0, 1, 3, 4, 6, 7, 9, 10 ...} etc.
- The maximum difference between two values in this section is +2, whereas the minimum difference is +1.
- While advancing according to the table, the very first time the difference between two MSLUT values is lower than +1 is between position 153 and position 154. Both entries are identical.
- The start value is 0 for the sine wave.
- The calculated value for position 256 (i.e. start of cosine wave) is 247.
- → Description is continued on next page.

Standard Sine	In order to set up the standard sine wave table, proceed as follows:
Wave Setup	Action:

- > Set a starting value *START_SIN* = 0 matching sine wave entry 0.
- Set a base wave inclination range of W0 = b'10 = 2 to skip between +1 / +2, valid from 0 to X1.
- > Calculate the differences between every entry: $\{+1, +2, +1, +2, +1, +2, +1, ...\}$.
- Set the microstep table entries ofsXX to 0 for the lower value (+1); 1 for the higher value (+2). Thus, the first seven microstep table entries ofs00 to ofs06 are: {0, 1, 0, 1, 0, 1, 0 ...}
- > The base wave inclination must be lowered at position 153, at very latest. Use the next base wave inclination range 1 with W1 = b'01 = 1 to skip between +0 and +1.
- > Set X1 = 153 in order to switch to the next inclination range. From here on, an offset *ofs*XX of 0 means add nothing; 1 means add +1.
- > Set *START_SIN90_120* = 247, which is equal to the value at position 256.
- Only two of four wave segments with different base wave inclinations are used. The remaining wave inclination ranges W2 and W3 should be set to the same value as W1; and X2 and X3 can be set to 255. Thereby, only two wave inclination segments are effective.

Result:

A standard sine wave is defined as MSLUT. The following table shows an extract of this curve.

Overview of the Microstep Behavior Example											
Microstep number	0	1	2	3	4	5	6	7	 153	154	 255
Desired table entry	0	1	3	4	6	7	9	10	 200	200	 247
Difference to next entry	1	2	1	2	1	2	1		 0		 0
Required segment inclination	+2	+2	+2	+2	+2	+2	+2		 +1		 +1
<i>Ofs</i> bit entry	0	1	0	1	0	1	0		 0		 0

11. Decoder Unit: Connecting ABN, SSI, or SPI Encoders correctly

TMC4330A is equipped with an encoder input interface for incremental ABN encoders, absolute SSI or SPI encoders. This chapter provides basic setup information for correct analysis of connected encoder signals.

Decoder Pins				
Pin Names	s Type Remarks			
A_SCLK	Input or Output	A signal of ABN encoder or Serial Clock output for absolute SSI, or SPI encoders.		
ANEG_NSCLK	Input or Output	Negated A signal of ABN encoder or Negated Serial Clock output for SSI encoder or Low active Chip Select signal for SPI encoders.		
B_SDI	Input	B signal of ABN encoder or Serial Data Input of SSI, or SPI encoders.		
BNEG_NSDI	Input or Output	Negated B signal of ABN encoder or Negated Serial Data Input of SSI encoders or Serial Data Output of SPI encoder.		
Ν	Input N signal of ABN encoder.			
NNEG	Input	Negated N signal of ABN encoder.		

Table 42: Dedicated Decoder Unit Pins

Decoder Unit Registers				
Register Name	Register ad	dress	Remarks	
GENERAL_CONF	0x00	RW	Bit11:10: serial_enc_in_mode, Bit12: diff_enc_in_disable	
INPUT_FILT_CONF	0x03	RW	Input filter configuration (SR_ENC_IN, FILT_L_ENC_IN).	
ENC_IN_CONF	0x07	RW	Encoder configuration register.	
ENC_IN_DATA	0x08	RW	Serial encoder input data structure.	
ENC_POS	0x50	RW	Current absolute encoder position in microsteps.	
ENC_LATCH	0x51	R	Latched absolute encoder position.	
ENC_POS_DEV	0x52	R	Deviation between XACTUAL and ENC_POS.	
ENC_CONST	0x54	R	Internally calculated encoder constant.	
Encoder Register Set	0x5158 0x6263	W	Encoder configuration parameter.	
Encoder velocity	0x65 0x66	R	Current encoder velocity (signed). Current filtered encoder velocity (signed).	
ADDR_TO_ENC DATA_TO_ENC	0x68 0x69	W	Serial encoder request data.	
ADDR_FROM_ENC DATA_FROM_ENC	0x6A 0x6B	R	Serial encoder request data response.	
Encoder compensation	0x7D	W	Encoder compensation register set.

11.1.1. Selecting the correct Encoder

The encoder interface consists of six pins that can be connected with different encoder types. Depending on the encoder type, the pins serve as inputs or as outputs. If inputs are assigned, the incoming signals can be filtered, as explained in chapter $\underline{4}$, page $\underline{17}$. Consequently, *SR_ENC_IN* and *FILT_L_ENC_IN* must be set accordingly. In the following, three options are presented to select a connected encoder properly.

OPTION 1: INCREMENTAL ABN ENCODERS

In order to set up a connected incremental ABN encoder, do as follows:

Action:

Set serial_enc_in_mode = b'00 (GENERAL_CONF register 0x00).

Result:

An incremental ABN encoder is selected.

OPTION 2: ABSOLUTE SSI ENCODERS

In order to set up a connected absolute SSI encoder, do as follows:

Action:

Set serial_enc_in_mode = b'01 (GENERAL_CONF register 0x00).

Result:

An absolute SSI encoder is selected.

i In order to avoid an erroneous status of the connected absolute SSI encoder, a proper configuration is necessary prior to enabling; as described further down below on the subsequent pages: see section <u>15.4.</u> on page <u>99</u>.

OPTION 3: ABSOLUTE SPI ENCODERS

In order to set up a connected absolute SPI encoder:

Action:

Set serial_enc_in_mode = b'11 (GENERAL_CONF register 0x00).

Result:

An absolute SPI encoder is selected.

- i In order to avoid an erroneous status of the connected absolute SPI encoder, a proper configuration is necessary prior to enabling; as described further down below on the subsequent pages: see section <u>15.4.</u> on page <u>99</u>.
- ●→Turn page for encoder pin assignment overview.

11.1.2. Disabling digital differential Encoder Signals

11.1.3. Inverting of

Encoder Direction If incremental ABN or absolute SSI encoders are selected, the dedicated encoder signals are treated as digital differential signals per default. For internally displaying a valid input level, the levels of a dedicated pair must be digitally inversed.

i No analog differential circuit is available.

In order to disable the digital differential input signals, do as follows:

Action:

Set diff_enc_in_disable = 1 (GENERAL_CONF register 0x00).

Result:

Dedicated encoder signals are treated as single signals and every negated pin is ignored.

i Concerning absolute SPI encoders, this is done automatically.

	Pin Assignment based on selected Encoder Setup								
Pin	Pin p. n.	Increme	ntal ABN	Absolu	Absolute SPI				
No.	Pin Name	Differential	Single-ended	Differential	Single-ended	Single-ended			
40	A_SCLK	А	А	SCLK	SCLK	SCLK			
1	ANEG_NSCLK	٦A	-	¬SCLK	-	CS			
10	B_SDI	В	В	SDI	SDI	SDI			
11	BNEG_NSDI	¬B	-	−SDI	-	SDO			
21	Ν	Ν	Ν	-	-	-			
22	NNEG	¬N	-	-	-	-			

Table 44: Pin Assignment based on selected Encoder Setup

In order to easily align the encoder direction with the motor direction it is possible to invert the encoder direction by setting one switch.

In order to invert the encoder direction, do as follows:

Action:

Set invert_direction = 1 (ENC_CONF register 0x07).

Result:

The calculation of the in external position *ENC_POS* is inverted, turning increment to decrement and vice versa.

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

If the encoder is installed correctly, the encoder values form a circle for one motor revolution. Thus, the deviation *ENC_POS_DEV* between real position *ENC_POS* und internal position *XACTUAL* forms a constant function over the whole motor revolution. Consequently, the resulting form of a deficiently installed encoder is oval-shaped. This system failure results in a new function of *ENC_POS_DEV* that is similar to a sine function. In figure A below, the position deviation is shown as function of one motor revolution, which comprises 51200 microsteps.

TMC4330A provides an option to compensate this kind of misalignment by adding a triangular shape function that counteracts the system error. This can improve the encoder value evaluation significantly. Per default, this function is constant at 0.

In order to setup the triangular compensation function, do as follows:

Action:

- > Set proper *ENC_COMP_XOFFSET* register 0x7D (15:0).
- > Set proper *ENC_COMP_YOFFSET* register 0x7D (23:16).
- > Set proper *ENC_COMP_AMPL* register 0x7D (31:24).

Result:

ENC_COMP_XOFFSET is 16-bit register which represents a numeral figure between 0 and 1. The resulting offset on the abscissa is calculated by:

XOFF_LOW = ENC_COMP_XOFFSET · microsteps/rev / 65536.

A triangular function is generated, which has its **lowest point at** (XOFF_LOW; ENC_COMP_YOFFSET).

The peak is shifted at a distance of half a revolution. The **peak coordinate** (XOFF_PEAK;YOFF_PEAK) is calculated as follows:

XOFF_PEAK = *ENC_COMP_XOFFSET* · microsteps/rev / 65536 + microsteps/rev / 2.

YOFF_PEAK = *ENC_COMP_YOFFSET* + *ENC_COMP_AMPL*.

In figure A below, the red line illustrates this compensation function.

Internally, the triangular function is added to the *ENC_POS* value. As a result, the position deviation is harmonized as a function of the motor revolution; which can be seen in figure B below.

Figure 52: Triangular Function that compensates Encoder Misalignments

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

11.2. Incremental ABN Encoder Settings

Incremental ABN encoders increment or decrement the external position counter register *ENC_POS* 0x50. This is based on A- and B-signal level transitions.

11.2.1. Automatic Constant Configuration of Incremental ABN Encoder The external position register *ENC_POS* 0x50 is based on internal microsteps. Thus, every AB transition is transferred to microsteps by a fixed constant value. TMC4330A is able to calculated this constant automatically.

In order to configure the incremental ABN encoder constant automatically, do as follows:

Action:

- > Set fullstep resolution of the motor in *FS_PER_REV* (*STEP_CONF* register 0x0A).
- > Set microstep resolution *MSTEP_PER_FS* (*STEP_CONF register* 0x0A).
- Set encoder resolution the number of AB transitions during one revolution in register ENC_IN_RES 0x54 (write access).

Result:

The encoder constant value *ENC_CONST* (readable at register 0x54) is calculated as follows:

ENC_CONST = MSTEP_PER_FS · FS_PER_REV / ENC_IN_RES

This constant is the number of microsteps through which *ENC_POS* is incremented or decremented by one AB transition.

- i ENC_CONST consists of 15 digits and 16 decimal places.
- i In case 16 bits are not sufficient for a binary representation of the decimal places, TMC4330A tries to match them to a multiple of 10000 within these 16 decimal places. Thereby, a perfect match can be achieved in case decimal representation is preferred to a binary one.
- In case the decimal representation also does not fit completely, the type of the decimal places of *ENC_CONST* can be selected manually with *ENC_IN_CONF*(0). Set *ENC_IN_CONF*(0) to 0 for binary representation; or set it to 1 for the decimal one. Keep in mind that with this approach *ENC_POS* can slightly differ from the real position; especially the further away the position moves from 0.

11.2.2. Manual Constant Configuration of Incremental ABN Encoder

For some applications it can be useful to define the encoder constant value, which in this case does not correspond to the number of microsteps per revolution; e.g. if the encoder is not mounted directly on the motor.

In order to configure the incremental ABN encoder constant manually, do as follows:

Action:

- ➢ Set *ENC_IN_RES*(31) =1.
- > Set *ENC_IN_CONF*(0) to 0 for a binary or to 1 for a decimal representation as explained in the previous section.
- > Set required encoder resolution in *ENC_IN_RES* (30:0) register 0x54.

Result:

ENC_CONST consists of 15 digits and 16 decimal places. The constant is the number of microsteps by which *ENC_POS* is incremented or decremented by one AB transition.

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany - Terms of delivery and rights to technical change reserved. Download newest version at: $\underline{www.trinamic.com}$.

11.3. Incremental Encoders: Index Signal: N resp. Z

The index signal (N or Z channel) represents a recurrence of the same position in one motor encoder revolution. TMC4330A makes use of this signal to clear the external position counter, or to take a snapshot of the external or internal position, which then can be used to refine the home position more precisely.

Figure 53: Outline of ABN Signals of an incremental Encoder

11.3.1. Per default, the index channel is configured low active. **Setup of Active** In order to set up high active polarity for the index channel, do as follows: **Polarity for Index Channel** Action: Set pol_n =1 (register ENC_CONF 0x07). **Result:** The index channel is high active. The active polarity of the index channel can be used to clear the external position 11.3.2. **Configuration of** counter or to take a snapshot of the external or internal position. Therefore, N Event N event is created internally. N event is based on the active polarity of the index channel. As addition, they can also be based on the polarities of the A and B channels. Index Channel Four active polarity configuration options for the index channel are available, which Sensitivity are presented below. Configuration choice depends on customer-specific design wishes. In order to set up the index channel sensitivity based on active polarity, do as follows:

Action:

Set n_chan_sensitivity (register ENC_CONF 0x07) to:

Index Channel Sensitivity					
n_chan_sensitivity Result					
b′00	N event is active in case index voltage level fits pol_n.				
b′01	N event is triggered when the index channel switches to active polarity.				
b′10	N event is triggered when the index channel switches to inactive polarity.				
b′11	N event is triggered at both edges when the index channel switches to either active or inactive polarity.				

Table 45: Index Channel Sensitivity

• → Description continued on next page.

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

A and B Channel Signal Polarities for N Event

It can be useful to specify A and B channel signal polarities for N event. Per default, the polarities of both signal lines are set to 0 (low active).

In order to set up A channel polarity to high active for N event, do as follows:

Action:

Set pol_a_for_n = 1 (ENC_CONF register 0x07).

Result:

Now, A channel signal polarity for N event is high active.

In order to set up B channel polarity to high active for N event, do as follows:

Action:

Set pol_b_for_n = 1 (ENC_CONF register 0x07).

Result:

Now, B channel signal polarity for N event is high active.

In case A and B channel polarities do not have an influence on N event, both A and B channel polarity signals can be ignored.

In order to ignore A and B channel polarities, do as follows:

Action:

Set ignore_ab = 1 (ENC_CONF register 0x07).

Result:

Now, the A and B channel signal polarities have no influence on N event.

N event can be used to clear the external position register ENC_POS 0x50. Two choices **External Position** are available: continous clearing and single clearing.

i Common practice is to clear to 0. However, TMC4330A offers the possibility to clear to any single microstep count.

In order to set ENC POS on N event to continuous clearing, do as follows: Action:

- Set ENC_RESET_VAL register 0x51 to the requested microstep position.
- > Set *clr latch cont on n* = 1 (*ENC CONF* register 0x07).
- Set clear_on_n = 1 (ENC_CONF register 0x07).

Result:

On every N event ENC_POS is set to ENC_RESET_VAL.

ENC_POS Single Clearing

11.3.3.

Counter

Clearing ENC_POS

Continous

Clearing

ENC POS

In order to only clear ENC POS for the next N event, do as follows:

Action:

- Set ENC_RESET_VAL register 0x51 to the requested microstep position.
- > Set *clr latch cont on n* = 0 (*ENC CONF* register 0x07).
- > Set *clr latch once on n = 1 (ENC CONF* register 0x07).
- Set clear_on_n = 1 (ENC_CONF register 0x07).

Result:

When the next N event occurs, ENC_POS is set to ENC_RESET_VAL. After the particular N event, *clr_latch_once_on_n* is automatically reset to 0.

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: www.trinamic.com .

11.3.4. Latching External Position	N event can be used to latch external position register <i>ENC_POS</i> $0x50$ to storage register <i>ENC_LATCH</i> $0x51$ (read access). Two choices are available: Continous latching and single latching.
Continous Encoder	In order to continuously latch <i>ENC_POS</i> to <i>ENC_LATCH</i> on N event, do as follows:
Latching	 Action: > Set <i>clr_latch_cont_on_n</i> = 1 (<i>ENC_CONF</i> register 0x07). > Set <i>latch_enc_on_n</i> = 1 (<i>ENC_CONF</i> register 0x07).
	Result: On every N event <i>ENC_POS</i> register 0x50 is latched to <i>ENC_LATCH</i> register 0x51.
Single Encoder Latching	In order to only latch <i>ENC_POS</i> to <i>ENC_LATCH</i> for the next N event, do as follows:
	 Action: Set <i>clr_latch_cont_on_n</i> = 0 (<i>ENC_CONF</i> register 0x07). Set <i>clr_latch_once_on_n</i> = 1 (<i>ENC_CONF</i> register 0x07). Set <i>latch_enc_on_n</i> = 1 (<i>ENC_CONF</i> register 0x07).
	Result: When the next N event occurs, <i>ENC_POS</i> register 0x50 is latched to <i>ENC_LATCH</i> register 0x51. After the particular N event, <i>clr_latch_once_on_n</i> is automatically reset to 0.
11.3.5. Latching Internal Position	N event can be used to latch internal position register X_ACTUAL 0x21 to storage register X_LATCH 0x36 (read access). Two choices are available: Continous latching and single latching.
Continous Latching	In order to continuously latch <i>X_ACTUAL</i> to <i>X_LATCH</i> on N event, do as follows:
	<pre>Action: > Set clr_latch_cont_on_n = 1 (ENC_CONF register 0x07). > Set latch_enc_on_n = 1 (ENC_CONF register 0x07). > Set latch_x_on_n = 1 (ENC_CONF register 0x07).</pre>
	Result: On every N event X_ACTUAL register 0x21 is latched to X_LATCH register 0x36.
Single Latching	In order to only latch <i>X_ACTUAL</i> to <i>X_LATCH</i> for the next N event, do as follows:
	<pre>Action: > Set clr_latch_cont_on_n = 0 (ENC_CONF register 0x07). > Set clr_latch_once_on_n = 1 (ENC_CONF register 0x07). > Set latch_enc_on_n = 1 (ENC_CONF register 0x07). > Set latch_x_on_n = 1 (ENC_CONF register 0x07).</pre>
	Result: When the next N event occurs, X_ACTUAL register 0x21 is latched to X_LATCH register

0x36. After the particular N event, *clr_latch_once_on_n* is automatically reset to 0.

 \odot 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

11.4. Absolute Encoder Settings

Serial encoders provide absolute encoder angle data in contrast to step transitions, which are delivered from incremental encoders.

TMC4330A provides an external clock for the encoder in order to trigger serial data input,

11.4.1.TMC4330A offers singleturn and multiturn options for the serial data stream**Singleturn or**interpretation. Per default, multiturn data is not enabled. In case multiturn data is**Multiturn Data**enabled, it is interpreted as unsigned count of revolutions.

In case multiturn encoder data is transmitted, do as follows:

Action:

- Set multi_turn_in_en = 1 (ENC_CONF register 0x07).
- OPTIONAL CONFIGURATION: Set multi_turn_in_signed = 1. In case multiturn data is provided as signed count of encoder revolutions.

Result:

Data from connected encoders are interpreted as multiturn data.

In case only singleturn data is transmitted TMC4330A is able to permanently calculate internally the number of encoder revolutions as if it where externally transferred multiturn data.

In case singleturn encoder data is transmitted but internally multiturn data is required, do as follows:

Action:

- Set multi_turn_in_en = 0 (ENC_CONF register 0x07).
- Set calc_multi_turn_behav = 1 (ENC_CONF register 0x07).

Result:

Data from connected singleturn encoders is internally transferred to multiturn data.

NOTE:

→ Multiturn calculations are only correct in case two consecutive singleturn data values differ only by one step less than a half turn difference, or even less.

11.4.2. Automatic Constant Configuration of Absolute Encoder The external position register *ENC_POS* 0x50 is based on internal microsteps. Thus, every input data angle is transferred to microsteps by a fixed constant value. TMC4330A is able to automatically calculate this constant.

In order to configure the absolute encoder constant automatically, do as follows:

Action:

- Set fullstep resolution of the motor in FS_PER_REV (STEP_CONF register 0x0A).
- Set microstep resolution MSTEP_PER_FS (STEP_CONF register 0x0A).
- > Set encoder resolution in register *ENC_IN_RES* 0x54 (write access).

Result:

The encoder constant value *ENC_CONST* (readable at register 0x54) is calculated as follows:

ENC_CONST = MSTEP_PER_FS · FS_PER_REV / ENC_IN_RES

The external position *ENC_POS* 0x50 is calculated by multiplying the constant with the transmitted input angle.

- i ENC_CONST consists of 15 digits and 16 decimal places.
- i In contrast to incremental ABN encoders, *ENC_CONST* is always represented as binary constant.

11.4.3. Manual Constant Configuration of incremental ABN Encoder For some applications it can be useful to define the encoder constant value, which in this case does not correspond to the number of microsteps per revolution; e.g. if the encoder is not mounted directly on the motor.

In order to configure the absolute encoder constant manually, do as follows:

Action:

- ➢ Set *ENC_IN_RES* (31) =1.
- > Set required encoder resolution in *ENC_IN_RES* (30:0) register 0x54.

Result:

 ENC_CONST consists of 15 digits and 16 decimal places. The external position ENC_POS 0x50 is calculated by multiplying the constant with the transmitted input angle.

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: www.trinamic.com .

11.4.4. Absolute Encoder Data Setup Encoder Data must be maintained correctly. Consequently, certain settings must be configured so that TMC4330A displays them as specified.

In order to configure absolute encoder data, do as follows:

Action:

Set SINGLE_TURN_RES (ENC_IN_DATA register 0x08) to the number of singleturn data bits -1.

OPTION A1: IF MULTITURN DATA IS TRANSMITTED

Set MULTI_TURN_RES (ENC_IN_DATA register 0x08) to the number of multiturn data bits -1.

OR OPTION A2: IF MULTITURN DATA IS NOT TRANSMITTED

- Set MULTI_TURN_RES = 0 (ENC_IN_DATA register 0x08).
- > Set *STATUS_BIT_CNT* (also register 0x08) to the number of status bits.

OPTION B1: IF STATUS FLAGS ARE ORDERED IN FRONT

Set left_aligned_data = 0 (ENC_IN_CONF register 0x07).

OR OPTION B2: IF STATUS FLAGS ARE ORDERED IN FRONT

Set *left_aligned_data* = 1 (*ENC_IN_CONF* register 0x07).

Result:

SINGLE_TURN_RES defines the most significant bit (MSB) of the angle data bits, whereas *MULTI_TURN_RES* defines the MSB of the revolution counter bits. Up to three status bits can be received. The number of transferred clock bits that are sent to the encoder is calculated as follows:

#SCLK Cycles= (*SINGLE_TURN_RES*+1) + (*MULTI_TURN_RES*+1) + *STATUS_BIT_CNT*

Also, the order in which the status bits occur in one encoder data stream can be configured. In Figure 54, example setups are depicted.

NOTE:

- → In case more than three status bits or additional fill bits are sent from the encoder, clock errors can occur because the number of transferred clock bits does not fit.
- → In order to prevent clock failures, MULTI_TURN_RES can be set to a higher value than otherwise required; even if the encoder does not provide multiturn data. This can result in erroneous multiturn data, which can be corrected by setting multi_turn_in_en=0 in order to skip multiturn data automatically.
- → In order to compensate unavailable multiturn data make use of calc_multi_turn_behav, as explained in section <u>15.4.1</u> on page <u>99</u>.

Figure 54:Serial Data Output: Four Examples

Key:

a) SINGLE_TURN_RES=6; MULTI_TURN_RES=4; STATUS_BIT_CNT=0; left_aligned_data=0

- b) SINGLE_TURN_RES=6; MULTI_TURN_RES=0; STATUS_BIT_CNT=2; left_aligned_data=0
- c) SINGLE_TURN_RES=5; MULTI_TURN_RES=4; STATUS_BIT_CNT=1; left_aligned_data=0
- d) SINGLE_TURN_RES=4; MULTI_TURN_RES=2; STATUS_BIT_CNT=3; left_aligned_data=1

• MAIN MANUAL •

11.4.5. Emitting Encoder Data Variation For some applications it can be useful to limit the difference between two consecutive encoder data values; for instance, if encoder data lines are subject to too much noise. Per default, encoder data values can show a difference of 1/8th per encoder revolution, only if the limitation is enabled. The difference can be configured to a smaller value, if necessary.

In order to enable and configure encoder data variation limitation, do as follows:

Action:

- OPTIONAL: Set proper SER_ENC_VARIATION register 0x63 (7:0).
- Set serial_enc_variation_limit =1 (ENC_IN_CONF register 0x07).

Result:

The encoder data value that is received subsequently must not exceed the previous data more than:

Maximum tolerated deviation = SER_ENC_VARIATION / 256 · 1/8 · ENC_IN_RES.

In case the variation exceeds the above mentioned limit, the new data value is rejected internally and the status flag *SER_ENC_DATA_FAIL* is raised.

i In case SER_ENC_VARIATION = 0, the limit is defined by 1/8 · ENC_IN_RES.

11.4.6. SSI Clock Generation

In order to receive encoder data from the absolute encoder, TMC4330A generates clock patterns according to SSI standard. Data transfer is initiated by switching the clock line SCLK from high to low level. The transfer starts with the next rising edge of SCLK. The number of emitted clock cycles depends on the expected data width, as explained in section <u>15.4.4</u>.

Configuration Details One clock cycle has a high and a low phase, which can be defined separately according to internal clock cycles. Per default, sample points of serial data are set at the falling edges of SCLK. Some encoders need more clock cycles – than are available during the low clock phase – in order to prepare data for transfer. Also, due to long wires, data transfer can take more time. To counteract the above mentioned issues, the delay time *SSI_IN_CLK_DELAY* (default value equals 0) for compensation can be specified in order to prolong the sampling start. Therefore, this delay configuration can automatically generate more clock cycles.

After a data request – when all clock cycles have been emitted – the serial clock must remain idle for a certain interval before the next request is automatically initiated. This interval *SER_PTIME* can also be configured in internal clock cycles.

i According to SSI standard, select an interval that is longer than 21 µs.

In order to configure the SSI clock generation, do as follows: Action:

- Set SINGLE_TURN_RES (ENC_IN_DATA register 0x08) to the number of singleturn data bits -1.
- Set MULTI_TURN_RES (ENC_IN_DATA register 0x08) to the number of multiturn data bits -1 in case multiturn data is enabled and used.
- > Set *STATUS_BIT_CNT* (*ENC_IN_DATA* reg. 0x08) to the number of status bits.
- > Set proper *left_aligned_data* (*ENC_IN_CONF* register 0x07).
- > Set proper *SER_CLK_IN_LOW* (register 0x56) in internal clock cycles.
- > Set proper SER_CLK_IN_HIGH (register 0x56) in internal clock cycles.
- OPTIONAL CONFIG: Set proper SSI_IN_CLK_DELAY (register 0x57) in internal clock cycles.
- > **OPTIONAL CONFIG:** Set proper SER_PTIME (reg. 0x58) in internal clk cycles.
- > Finally, set serial_enc_in_mode = b'01.

Result:

TMC4330A emits serial clock streams at SCLK in order to receive absolute encoder data at SDI. If *SSI_IN_CLK_DELAY* > 0, the SDI sample points are delayed (see figures below). *SER_PTIME* defines the interval between two consecutive data requests.

i If differential encoder is selected, the negated clock emits at ¬SCLK; and ¬SDI is also evaluated.

Serial data in ... MSB LISB LSB Sample points

• MAIN MANUAL •

11.4.7. Enabling Multicycle SSI request

11.4.8.

Streams

Gray-encoded SSI Data If safe transmission must be determined, it is possible to send a second request so that the encoder repeats the same encoder data. Therefore, a second interval *SSI_WTIME* must be defined.

i According to SSI standard, select an interval that is shorter than 19 μ s.

In order to enable multicycle requests, do as follows:

Action:

- Set ssi_multi_cycle_data =1 (ENC_IN_CONF register 0x07).
- > Set proper *SSI_WTIME* (register 0x57) in internal clk cycles.

Result:

After a data request – when all clock cycles have been emitted – the serial clock remains idle for *SSI_WTIME* clock cycles. Afterwards, the second request is automatically initiated to receive the same encoder data. If the second encoder data differs from the first one, error flag *MULTI_CYCLE_FAIL* (register 0x0F) and error event *SER_ENC_DATA_FAIL* (register 0x0E) is generated.

After the second data request, the next interval lasts *SER_PTIME* clock cycles to request new encoder data.

Several but not all SSI encoders emit angle data, which is gray-encoded. TMC4330A is able to decode this data automatically.

In order to enable gray-encoded angle data, do as follows:

Action:

Set ssi_gray_code_en =1 (ENC_IN_CONF register 0x07).

Result:

Encoder data is recognized as gray-encoded and thus also decoded accordingly.

11.4.9. SPI Encoder Data Evaluation

SPI encoder interfaces typically consist of four signal lines. In addition to SSI encoder signal lines (SCLK, MISO), a chip select line (CS) and a data input (MOSI) to the master is provided.

SPI Encoder
Communication
ProcessThe number of bits per transfer is calculated automatically; based on proper
multi_turn_in_en, SINGLE_TURN_RES, MULTI_TURN_RES, and STATUS_BIT_CNT, as
explained in sections 15.4.1 (page 99) and 15.4.4 (page 101).A typical SPI communication process responds to any SPI data transfer request when

A typical SPI communication process responds to any SPI data transfer request when the next transmission occurs. When TMC4330A receives an answer from the encoder, it calculates *ENC_POS* immediately. The encoder slave does not send any data without receiving a request first.

Therefore, TMC4330A always sends *ADDR_TO_ENC* value to request encoder data from the SPI encoder slave device. The LSB of the serial data output is *ADDR_TO_ENC* (0).

Received encoder data is stored in *ADDR_FROM_ENC*. Thus, encoder values can be verified and compared to microcontroller data later on.

i The clock generation works similarly to SSI clock generation, as described in section <u>15.4.5</u> on page <u>103</u>; based on proper *SER_CLK_IN_HIGH, SER_PTIME,* and *SER_CLK_IN_LOW*.

In order to configure a basic SPI communication procedure, do as follows:

Action:

- Set SINGLE_TURN_RES (ENC_IN_DATA register 0x08) to the number of singleturn data bits -1.
- Set MULTI_TURN_RES (ENC_IN_DATA register 0x08) to the number of multiturn data bits -1 in case multiturn data is enabled and used.
- Set STATUS_BIT_CNT (ENC_IN_DATA register 0x08) to the number of status bits.
- > Set proper *left_aligned_data* (*ENC_IN_CONF* register 0x07).
- > Set correct SPI transfer mode that is described in the next section.
- Set ADDR_TO_ENC register 0x68 to the specified SPI encoder address that contains angle data.
- > Set proper *SER_CLK_IN_LOW* (register 0x56) in internal clock cycles.
- > Set proper SER_CLK_IN_HIGH (register 0x56) in internal clock cycles.
- OPTIONAL CONFIG: Set proper SER_PTIME (register 0x58) in internal clk cycles.
- Finally, set serial_enc_in_mode = b'11.

Result:

TMC4330A emits serial clock streams at SCLK in order to receive absolute encoder data at SDI pin. The number of generated clock cycles depends on *SINGLE_TURN_RES, MULTI_TURN_RES,* and *STATUS_BIT_CNT*.

Pin ANEG_NSCLK functions as negated chip select line for the SPI encoder that is generated according to the serial clock and the selected SPI mode; which is described in the next section.

Pin BNEG_NSDI is the MOSI line that transfers SPI datagrams to the SPI encoder. Datagrams, which are transferred permanently to receive angle data, consists of *ADDR_TO_ENC* data.

SER_PTIME defines the interval between two consecutive data requests.

●→Turn page for information on SPI mode selection.

encoder data transfer is managed in th

11.4.10. SPI Encoder Mode Selection

Per default, SPI encoder data transfer is managed in the same way as the communication between microcontroller and TMC4330A. TMC4330A supports all four SPI modes with proper setting of switches *spi low before_cs* and *spi_data_on_cs*.

THE PROCESS IS AS FOLLOWS:

By setting *spi_low_before_cs* = 0, negated chip select line at ANEG_NSCLK is switched to active low **before** the serial clock line SCLK switches.

By setting *spi_low_before_cs* = 1, negated chip select line at ANEG_NSCLK is switched to active low **after** the serial clock line SCLK switches.

By setting *spi_data_on_cs* = 0, the first data bit at BNEG_NSDI is changed at the same time as the first slope of the serial clock SCLK.

By setting *spi_data_on_cs* = 1, the first data bit at BNEG_NSDI is changed at the same time as the negated chip select signal at BNEG_NSDI switches to active level.

In the table below, all four SPI modes are presented.

Per default, the delay between serial clock line and negated chip select line has a time frame of either *SER_CLK_IN_HIGH* or *SER_CLK_IN_LOW* clock cycles, which depends on the actual voltage level of the serial clock.

This particular interval does not always match the encoder behavior perfectly. Therefore, both the first and last intervals between the serial clock line and the negated chip select line can be specified separately in clock cycles at *SSI_IN_CLK_DELAY* register 0x57.

Below, the *SSI_IN_CLK_DELAY* interval is highlighted in red in all four diagrams.

Table 46: Supported SPI Encoder Data Transfer Modes

MAIN MANUAL

11.4.11. SPI Encoder Configuration via TMC4330A

Connected SPI encoder can be configured via TMC4330A., which renders a connection between microcontroller and encoder unnecessary.

SPI Encoder Configuration Communication Process	A configuration request is sent using the settings of <i>SERIAL_ADDR_BITS</i> and <i>SERIAL_DATA_BITS</i> , which define the transferring bit numbers.
	In order to prepare SPI encoder configuration procedures, do as follows: Action:
	Action:

- Set SERIAL_ADDR_BITS (ENC_IN_DATA register 0x08) to the number of address bits of any SPI encoder configuration datagram.
- Set SERIAL_DATA_BITS (ENC_IN_DATA register 0x08) to the number of data bits of any SPI encoder configuration datagram.

Result:

In case configuration data is transferred to the SPI encoder, *SERIAL_ADDR_BITS* bits and *SERIAL_DATA_BITS* bits are sent in two SPI configuration datagrams; exactly in this order.

Because encoder data requests occur as an endless stream, it is necessary to interrupt data requests when a configuration request occurs. Consequently, a handshake behavior is implemented.

In order to transfer configuration data to the SPI encoder, do as follows:

Action:

- > Set *DATA_TO_ENC* register 0x69 to any value.
- > Set *ADDR_TO_ENC* register 0x68 to the configuration address of the SPI encoder.
- > Set *DATA_TO_ENC* register 0x69 to the configuration data of the SPI encoder.

Result:

The first *DATA_TO_ENC* access stops the repetitive encoder data request.

- After the second *DATA_TO_ENC* access, three datagrams are sent to SPI encoder:
- 1. One address datagram is transmitted, which contains the *ADDR_TO_ENC* value. Data that is received simultaneously with the request is not stored.
- 2. One data datagram is transmitted that contains the *DATA_TO_ENC* value. Data that is received simultaneously with the request is stored in *ADDR_FROM_ENC* register 0x6A because this is the response of the *ADDR_TO_ENC* request.
- 3. One no-operation datagram (NOP) is transmitted. Data that is received simultaneously with the request is stored in *DATA_FROM_ENC* register 0x6B because this is the response of the *DATA_TO_ENC* request.

In order to finalize the configuration procedure and continue with the encoder data requests, do as follows:

- > Read out *ADDR_FROM_ENC* register 0x6A first.
- > Set *ADDR_TO_ENC* register 0x68 to the specified SPI encoder address that contains angle data.
- > Obligatory at finalization: Read out *DATA_FROM_ENC* register 0x6B.

Result:

The configuration request data is read out. After *DATA_FROM_ENC* register readout, the encoder data request stream of angle data continues.

12. Possible Regulation Options with Encoder Feedback

Beyond simple feedback monitoring, encoder feedback can be used for controlling motion controller outputs in such a way that the internal actual position matches or follows the real position *ENC_POS*. Two options are provided: PID control and closed-loop operation. Closed-loop operation is preferable if the encoder is mounted directly on the back of the motor and position data is evaluated precisely. PID control is preferable if the encoder is located on the drive side with no fixed connection between motor and drive side; e.g. belt drives.

Closed-Loop and PID Registers					
Register Name	Register address		Remarks		
ENC_IN_CONF	0x07	RW	Encoder configuration register: Closed-Loop configuration switches.		
CL_TR_TOLERANCE	0x51	R	Absolute tolerated deviation to trigger TARGET_REACHED during regulation.		
ENC_POS_DEV	0x52	R	Deviation between XACTUAL and ENC_POS.		
Closed-Loop and PID Register Set	0x595F 0x6061	W	Closed-Loop and PID configuration parameters.		
Encoder velocity configuration	0x63	W	Encoder velocity filter configuration parameters.		
Encoder velocity	0x65 0x66	R	Current encoder velocity (signed). Current filtered encoder velocity (signed).		

Table 47: Dedicated Closed-Loop and PID Registers

12.1. Feedback MonitoringBased on the difference *ENC_POS_DEV* (readout at register 0x52) between internal position *XACTUAL* and external position *ENC_POS*, a status flag *ENC_FAIL_F* and a corresponding error event *ENC_FAIL* is generated automatically.

In order to set a tolerated position mismatch, do as follows:

Action:

Set ENC_POS_DEV_TOL register 0x53 to the maximum microstep value that represents no mismatch failure.

Result:

In case $|ENC_POS_DEV| \le ENC_POS_DEV_TOL$, no encoder failure flag is set. In case $|ENC_POS_DEV| > ENC_POS_DEV_TOL$, ENC_FAIL_F ag is set.

i At this point, the corresponding encoder event *ENC_FAIL* is also triggered.

12.1.1. Target-Reached during Regulation In case one of the regulation modes is selected, TARGET_REACHED event and status flag is only released when:

XACTUAL = XTARGET and $|ENC_POS_DEV| \leq CL_TR_TOLERANCE$.

Consequently, *CL_TR_TOLERANCE* register 0x52 (only write access) is the maximal tolerated position mismatch for target reached status.

12.2. PID-based Control of *XACTUAL* Based on a position difference error $PID_E = XACTUAL - ENC_POS$ the PID (proportional integral differential) controller calculates a signed velocity value (v_{PID}), which is used for minimizing the position error. During this process, TMC4330A moves with v_{PID} until $|PID_E| - PID_TOLERANCE \le 0$ is reached and the position error is removed.

v_{PID} is calculated by:

$$v_{PID} = \frac{PID_P}{256} \cdot PID_E \cdot \left[\frac{1}{s}\right] + \frac{PID_I}{256} \cdot \int_{0}^{t} PID_E \cdot dt + PID_D \cdot PID_E \cdot \frac{d}{dt}$$
$$v_{PID} = \frac{PID_P}{256} \cdot PID_E \cdot \left[\frac{1}{s}\right] + \frac{PID_I}{256} \cdot PID_ISUM + PID_D \cdot PID_E \cdot \frac{d}{dt}$$
$$v_{PID} = \frac{PID_P}{256} \cdot PID_E \cdot \left[\frac{1}{s}\right] + \frac{PID_I}{256} \cdot PID_E \cdot \frac{f_{CLK}}{128} + PID_D \cdot PID_E \cdot \frac{d}{dt}$$

Key:

PID_P = proportional term; PID_I = integral term; PID_D = derivate term

12.2.1.
PID Readout
ParametersThe following parameters can be read out during PID operation.PID_Readout
ParametersActual PID output velocity.PID_VEL 0x5AActual PID output velocity.PID_E 0x5DActual PID position deviation between XACTUAL and ENC_POS.PID_ISUM 0x5BActual PID integrator sum (update frequency: fclk/128), which is calculated by:
PID_ISUM=PID_E · fclk /128

●→Turn page for information on configuration of PID regulation.

12.2.2. PID Control Parameters and Clipping Values	In order to set parameters and clipping values for PID regulation correctly, consider the following details:
PID_DV_CLIP 0x5E	Large velocity variations are avoided by limiting v_{PID} value with <i>PID_DV_CLIP</i> (register 0x5E). This clipping parameter limits both v_{PID} and <i>PID_VEL</i> .
PID_I_CLIP 0x5D (14:0)	The error sum PID_ISUM (read out at 0x5B) is generated by the integral term. <i>PID_ISUM</i> is limited by setting <i>PID_I_CLIP</i> register 0x5D.
	i The maximum value of PID_I_CLIP must meet the condition $PID_I_CLIP \le PID_DV_CLIP PID_I$.
	i If the error sum <i>PID_ISUM</i> is not clipped, it is increased with each time step by <i>PID_I</i> · <i>PID_E</i> . This continues as long as the motor does not follow.
PID_D_CLKDIV 0x5D (23:16)	Time scaling for deviation (with respect to error correction periods) is controlled by <i>PID_D_CLKDIV</i> register.
	 During error correction, fixed clock frequency fPID_INTEGRAL is valid: fPID_INTEGRAL[Hz] = fCLK[Hz] / 128
VEL_ACT_PID	The internal velocity VEL_ACT_PID alters actual ramp velocity <i>VACTUAL</i> . Two settings are provided: In case <i>regulation_modus</i> = b'11, <i>VACTUAL</i> is assigned as pulse generator base value and VEL_ACT_PID is calculated by VEL_ACT_PID = <i>VACTUAL</i> + v _{PID} . In case <i>regulation_modus</i> = b'10, zero is assigned as pulse generator base value. Now, VEL_ACT_PID = v _{PID} is valid.
PID_TOLERANC E 0x5F	TMC4330A provides the programmable hysteresis <i>PID_TOLERANCE</i> for target position stabilization; which avoids oscillations through error correction in case <i>XACTUAL</i> is close to the real mechanical position.
	The PID controller of TMC4330A is programmable up to approximate 100 kHz update rate (at $f_{CLK} = 16$ MHz). This high speed update rate qualifies PID regulation for motion stabilization.
12.2.3. Enabling PID	Now that PID control parameters and clipping values are configured, as explained above, PID regulation can be enabled. Two options can be selected.
Regulation	In order to enable PID control, do as follows:
	Action:
	<u>OPTION 1: BASE PULSE GENERATOR VELOCITY = 0</u>
	Set regulation_modus = b'10 (ENC_IN_CONF register 0x07).
	OPTION 2: BASE PULSE GENERATOR VELOCITY = VACTUAL
	Set regulation_modus = b'11 (ENC_IN_CONF register 0x07).
	Result: PID regulation is enabled.
	NOTE
	→ Detailed knowledge of a particular application (including dynamics of mechanics)

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: <u>www.trinamic.com</u>.

is necessary for PID controller parameterization.

111/166

12.3. Closed-Loop Operation

The closed-loop unit of TMC4330A directly modifies Step/Dir outputs of the internal step generator; which is dependent on the feedback data. The 2-phase closed-loop control of TMC4330A follows a different approach than Field-Oriented Control (FOC); which is similar to PID control cascades. The ramp generator, which assigns target and velocity, is independent of position control (commutation angle control); which is also independent of S/D output control.

12.3.1. Basic Closed- Loop Parameters	Closed-loop does not control current values via the internal step generator. The currents values at the SPI output and the Step/Dir outputs are verified using the evaluated difference between internal position <i>XACTUAL</i> and external position <i>ENC_POS</i> ; considering the calibrated offset parameter <i>CL_OFFSET</i> .
	In order to set parameters and clipping values for closed-loop regulation correctly, consider the following details:
CL_OFFSET 0x59	This register contains the basic offset value between internal and external position during calibration process, which is necessary for closed-loop operation, and offers read-write access. The write access can be used if a defined fixed offset value is preferred, which is verified beforehand.
ENC_POS_DEV 0x52	The continuously updated parameter <i>ENC_POS_DEV</i> displays the deviation between <i>XACTUAL</i> and <i>ENC_POS</i> ; considering <i>CL_OFFSET</i> .
CL_BETA 0x1C (8:0)	<i>CL_BETA</i> is the maximum commutation angle that is used to compensate an evaluated deviation <i>ENC_POS_DEV</i> . In case the deviation reaches <i>CL_BETA</i> value, the commutation angle remains stable at this value to follow the overload. Also, <i>CL_MAX</i> event is triggered at this point.
CL_TOLERANCE 0x5F (7:0)	This parameter is set to select the tolerance range for position deviation. In case $ ENC_POS_DEV \le CL_TOLERANCE$, CL_FIT_F lag becomes set. In case a mismatch between internal and external position occurs, CL_FIT event is triggered to signify when the mismatch is removed.
CL_DELTA_P 0x5C	CL_DELTA_P is a proportional controller that compensates a detected position deviation between internal and external position. See also Figure 57, page 112. In case $ ENC_POS_DEV \leq CL_TOLERANCE$, CL_DELTA_P is automatically set to 1.0. In case $ ENC_POS_DEV > CL_TOLERANCE$, the closed-loop unit of TMC4330A multiplies ENC_POS_DEV with CL_DELTA_P and adds the resulting value to the current ENC_POS . Thus, a current commutation angle for higher stiffness position maintenance, which is clipped at CL_BETA , is calculated.
	 <i>CL_DELTA_P</i> consists of 24 bits. The last 16 bits represent decimal places. The final proportional term is thus calculated by: p_{PID} = <i>CL_DELTA_P</i> / 65536. Therefore, the higher p_{PID} the faster the reaction on position deviations. <u>NOTE:</u>
	\rightarrow A high p _{PID} term can lead to oscillations that must be avoided.
CL_CYCLE 0x63 (31:16)	In case, one absolute encoder is connected, this value represents the delay time in numbers of clock cycles between two consecutive regulation cycles. It is recommended to adjust this value to the regulation cycle; which is either equal or slower than the encoder request rate. In case incremental ABN encoder is selected, this value is automatically set to fetch the fastest possible regulation rate; which in most cases are five clock cycles.

Figure 57: Calculation of the Output Angle with appropriate CL_DELTA_P

12.3.2. Enabling and calibrating Closed-Loop Operation Now that basic closed-loop control parameters are configured, as explained above, closed-loop regulation can be enabled.

i The presented calibration process is very basic. Refer to the closed-loop Application Note for detailed calibration process information.

In order to enable and calibrate closed-loop control, do as follows:

PRECONDITION: SET TO BEST POSSIBLE MAXIMUM CURRENT SCALING

<u>PROCEED WITH: OPTION 1: CL_OFFSET IS GENERATED DURING</u> <u>CALIBRATION</u>

Action:

- Set MSTEPS_PER_FS = 0 (STEP_CONF register 0x0A) [256 microsteps per fullstep].
- > Move to any fullstep position (*MSCNT* mod 128 = 0).
- Set regulation_modus = b'01 (ENC_IN_CONF register 0x07).
- Set cl_caclibration_en =1 (ENC_IN_CONF register 0x07).
- > Wait for a defined time span (system settle down).
- Set cl_caclibration_en =0 (ENC_IN_CONF register 0x07).

Result:

Closed-loop operation is enabled with basic calibration. *CL_OFFSET* is set to position mismatch during calibration process.

OR PROCEED WITH OPTION 2: CL OFFSET IS USED FOR CALIBRATION

In case *CL_OFFSET* was saved and no position loss has occurred while closed-loop operation was disabled, it can be used to replace the calibration process.

Action:

- Set MSTEPS_PER_FS = 0 (STEP_CONF register 0x0A) → 256 microsteps per fullstep.
- Set regulation_modus = b'01 (ENC_IN_CONF register 0x07).
- > Set *CL_OFFSET* to any preferred microstep value.

Result:

Closed-loop operation is enabled.

12.3.3.	In order to limit catch-up velocities in case a disturbance of regular motor motion must
Limiting	be compensated, the following parameters can be configured accordingly:
Closed-Loop Catch-Up Velocity	i Refer to section <u>16.2.</u> on page <u>109</u> for more information about PI regulation of the maximum velocity because it uses the same PI regulator like the position PID regulator. The base velocity is the actual ramp velocity <i>VACTUAL</i> .
CL_VMAX_CALC_P 0x5A	P parameter of the PI regulator, which controls the maximum velocity.
CL_VMAX_CALC_I 0x5B	I parameter of the PI regulator, which controls the maximum velocity.
PID_DV_CLIP 0x5E	<i>PID_DV_CLIP can</i> be set in order to avoid large velocity variations; and also to limit the maximum velocity deviation above the maximum velocity <i>VMAX</i> .
PID_I_CLIP 0x5D	This parameter is used together with <i>PID_DV_CLIP</i> in order to limit the velocity for error compensation. The error sum <i>PID_ISUM</i> is generated by the integral term. In case this error sum must be limited, set <i>PID_I_CLIP</i> . It is advisable to set the maximum value of <i>PID_I_CLIP</i> to:
	$PID_I_CLIP \leq PID_DV_CLIP PID_I.$
	i In case the error sum <i>PID_ISUM</i> is not clipped, it is increased with each time step by <i>PID_I</i> · <i>PID_E</i> . This continues as long as the motor does not follow.
12.3.4. Enabling the	Now that PI control parameters and clipping values are configured, as explained above, limiting catch-up velocities can be enabled.
Limitation of the	
	In order to enable limitation of closed-loop catch-up velocity, do as follows:
Catch-Up Velocity	<pre>In order to enable limitation of closed-loop catch-up velocity, do as follows: Action: > Set cl_vlimit_en = 1 (ENC_IN_CONF register 0x07).</pre>
Catch-Up	Action:
Catch-Up	<pre>Action: > Set cl_vlimit_en = 1 (ENC_IN_CONF register 0x07). Result:</pre>
Catch-Up	<pre>Action: > Set cl_vlimit_en = 1 (ENC_IN_CONF register 0x07). Result: Closed-loop catch-up velocity is limited according to the configured parameters. NOTE: → A higher motor velocity than specified VMAX (for negative velocity: -VMAX) is possible if the following conditions are met:</pre>

Catch-Up	<pre>Action: > Set cl_vlimit_en = 1 (ENC_IN_CONF register 0x07). Result: Closed-loop catch-up velocity is limited according to the configured parameters. NOTE: → A higher motor velocity than specified VMAX (for negative velocity: -VMAX) is possible if the following conditions are met: - Closed-loop operation is enabled. - Closed-loop catch-up velocity is not enabled, or is enabled with PID_DV_CLIP > 0; and CL_VMAX_CALC_P and CL_VMAX_CALC_I are higher than 0.</pre>
Catch-Up Velocity	 Action: > Set cl_vlimit_en = 1 (ENC_IN_CONF register 0x07). Result: Closed-loop catch-up velocity is limited according to the configured parameters. NOTE: A higher motor velocity than specified VMAX (for negative velocity: -VMAX) is possible if the following conditions are met: Closed-loop operation is enabled. Closed-loop catch-up velocity is not enabled, or is enabled with PID_DV_CLIP > 0; and CL_VMAX_CALC_P and CL_VMAX_CALC_I are higher than 0. ENC_POS_DEV > CL_TOLERANCE resp. ENC_POS_DEV < CL_TOLERANCE. In case the internal ramp has stopped, and the position mismatch still needs

Some applications only require maintaining a specified velocity value during closed-loop behavior, regardless of position mismatches. TMC4330A also provides this option.

NOTE:

→ The closed-loop velocity mode is set independent of the internal ramp operation mode (velocity or positioning mode).

In order to enable and calibrate closed-loop control, do as follows:

Action:

- Set the catch-up velocity parameters, as explained in detail in section <u>16.3.3</u>, page <u>113</u>.
- Set cl_vlimit_en = 1 (ENC_IN_CONF register 0x07).
- Set cl_velocity_mode_en = 1 (ENC_IN_CONF register 0x07).

Result:

Closed-loop operation velocity mode is enabled.

In case position mismatch $|ENC_POS_DEV|$ exceeds 768 microsteps, internal position counter *XACTUAL* is set automatically to $ENC_POS \pm$ 768 to limit the position mismatch.

Thus, closed-loop operation maintains the specified velocity value VMAX.

 A higher motor velocity than specified VMAX (for negative velocity: -VMAX) is possible if PID_DV_CLIP > 0.

12.3.6. Back-EMF Compensation during Closed-loop Operation

When higher velocities are reached, a phase shift between current and voltage occurs at the motor coils. Consequently, current control is transformed into voltage control.

This motor- and setup-dependent effect must be compensated because currents are still continuously assigned for motor control. TMC4330A attributes γ -correction to the compensation process, which adds a velocity-dependent angle - in motion direction - to the current commutation angle.

Load Angle Calculation Gamma correction constantly adds one compensation angle, GAMMA, to the actual commutation angle; because the velocity-dependent amount of the influence of Back-EMF, GAMMA is also velocity-dependent. Thus, velocity limits are assigned. These limits are based on REAL motor velocity V_ENC (register 0x65). The value of the motor velocity is internally calculated and can be filtered (V_ENC_MEAN register 0x66) to smoothen the γ -correction, which is explained in the next section.

In order to configure and enable Back-EMF compensation during closedloop operation, do as follows:

Action:

- > Set proper *CL_GAMMA* register 0x1C.
- > Set proper *CL_VMIN_EMF* register 0x60.
- > Set proper *CL_VMAX_EMF* register 0x61.
- Set cl_emf_en = 1 (ENC_IN_CONF register 0x07).

Result:

Back-EMF compensation during closed-loop operation is enabled. *CL_GAMMA* represents the maximum value of GAMMA. Per default, *CL_GAMMA* is set to its maximal possible value of 255, which represents a 90° angle. The following compensation situations are possible:

- 1. In case $|V_ENC_MEAN| \leq CL_VMIN_EMF$, GAMMA is set to 0.
- In case | V_ENC_MEAN| > CL_VMIN_EMF and |V_ENC_MEAN| ≤ (CL_VMIN_EMF + CL_VADD_EMF), GAMMA is scaled linearly between 0 and its maximum value.
- In case | V_ENC_MEAN| > (CL_VMIN_EMF + CL_VADD_EMF), GAMMA = CL_GAMMA.

The chart below identifies the actual parameter GAMMA, which is dependent on the above described situations:

If γ -correction is turned on, the maximum possible commutation is $(CL_BETA + CL_GAMMA)$.

Areas of Special Concern

This value must not exceed 180° (511 microsteps at 256 microsteps per fullstep) because angles of 180° or more will result in unwanted motion direction changes.

Figure 58: Calculation of the actual Load Angle GAMMA

Read entire documentation; especially the "Supplemental Directives" on page 160.

12.3.7. Encoder Velocity Readout Parameters	In case an encoder is connected, REAL motor velocity can be read out. The actual encoder velocity flickers. This is system-immanent. TMC4330A provides filter options that back-EMF compensation is based on. The following velocity parameters can be read out.
V_ENC 0x65	Actual encoder velocity in pulses (microsteps) per second [pps].
V_ENC_MEAN 0x66	Actual filtered encoder velocity in pulses (microsteps) per second [pps].
12.3.8. Encoder Velocity Filter Configuration	In order to set filter parameters correctly, consider the following details:
ENC_VMEAN_WAIT 0x63 (7:0)	<i>ENC_VMEAN_WAIT</i> represents the delay period in number of clock cycles between two consecutive <i>V_ENC</i> values that are used for the encoder filter velocity calculation. The lower this value, the faster the adaptation process of <i>V_ENC_MEAN</i> is. Accordingly: The higher the gradient of <i>V_ENC_MEAN</i> is. In case incremental ABN encoders are connected, <i>ENC_VMEAN_WAIT</i> must be set above 32. In case absolute encoders are connected, <i>ENC_VMEAN_WAIT</i> is automatically set to <i>SER_PTIME</i> .
ENC_VMEAN_FILTER 0x63 (11:8)	This filter exponent is used for filter calculations. The lower this value, the faster the adaptation process of V_ENC_MEAN is. Accordingly: The higher the gradient of V_ENC_MEAN is. Every ENC_VMEAN_WAIT clock cycles, the following calculation applies:
	$V_{ENC_{MEAN}} = V_{ENC_{MEAN}} - \frac{V_{ENC_{MEAN}}}{2^{ENC_{VMEAN}, FILTER}} + \frac{V_{ENC}}{2^{ENC_{VMEAN}, FILTER}}$
ENC_VMEAN_INT 0x63 (31:16)	The refresh frequency of high encoder velocity values <i>V_ENC</i> is determined by this encoder velocity update period. In case incremental ABN encoders are connected, the minimum value of <i>ENC_VMEAN_INT</i> is automatically set to 256. In case absolute encoders are connected, <i>ENC_VMEAN_INT</i> is automatically adapted to encoder value request rate.
12.3.9. Encoder Velocity equals 0 Event	Because internal calculation of low V_ENC values is triggered by AB signal changes and not by the refresh frequency defined by ENC_VMEAN_INT , any occurring idle state of the encoder is not recognized. In order to determine that $V_ENC = 0$, it is possible to limit the number of clock cycles while no AB signal changes occur; which then signifies encoder idle state.
	In order to evoke encoder idle state, do as follows:
	Action: ➤ Set proper <i>ENC_VEL_ZERO</i> register 0x62.
	Result: In case no AB signal changes occur during <i>ENC_VEL_ZERO</i> clock cycles, <i>ENC_VEL0</i> event is triggered, which indicates encoder idle state.

13. Reset and Clock Gating

In addition to the hardware reset pin NRST and the automatic Power-on-Reset procedure, TMC4330A provides a software reset option. If not in operation, clock gating can be used to reduce power consumption.

Reset and Clock Pins				
Pin Names	Types	Remarks		
NRST	Input	Low active hardware reset.		
STPIN	Input	High active wake-up signal.		
CLK_EXT	Input	Connected external clock signal.		

Table 48: Dedicated Reset and Clock Pins

Reset and Clock Gating Registers					
Register Name	Register ad	dress	Remarks		
GENERAL_CONF	0x00	RW	Bit18:17		
CLK_GATING_DELAY	0x14	RW	Dela time before clock gating is enabled.		
CLK_GATING_REG	0x4F (2:0)	RW	Trigger for clock gating.		
RESET_REG	0x4F (31:8)	RW	Trigger for SW-Reset.		

Table 49: Dedicated Reset and Clock Gating Registers

13.1. Manual Hardware Reset	A hardware reset is provided by the NRST input pin.
	In order to reset TMC4330A, do as follows:
	Action: ➤ Set NRST input to low voltage level.
	Result: TMC4330A registers are reset to default values.
	<u>NOTE:</u>
	\rightarrow During power-up of TMC4330A, Power-on-Reset is executed automatically.
13.2.	In order to reset TMC4330A without use of NRST pin, do as follows:
Manual Software Reset	Action: ≻ Set <i>RESET_REG</i> = 0x525354 (Bits31:8 of register 0x4F).
	Result: TMC4330A registers are reset to default values.
13.3.	<i>RST_EV</i> = EVENTS(31) is set as indicator signifying that one of the possible

Reset Indication reset conditions was triggered.

13.4. Activating Clock Gating manually

13.5.

Clock Gating

Wake-up

Clock gating must be enabled before activation. In addition, the delay between activation and the active clock gating phase can be configured.

In order to activate clock gating manually, do as follows:

PRECONDITION: VEL STATE F = "00" INDICATING THAT VACTUAL = 0.

Action:

- Set clk_gating_en = 1 (bit17 of GENERAL_CONF register 0x00).
- > Set proper CLK_GATING_DELAY register 0x14.
- > Set *CLK_GATING_REG* = 0x7 (bit2:0 of register 0x4F).

Result:

When writing to *CLK_GATING_REG*, this activates the *CLK_GATING_DELAY* counter, which specifies the delay between clock gating trigger and activation in [number of cycles]. When the counter reaches 0, clock gating is activated. See figure below.

<u>NOTE :</u>

→ In case CLK_GATING_REG = 0, clock gating is executed immediately after activating the CLK_GATING_REG register. See figure below.

In order to conduct clock gating wake-up, do as follows:

Action:

Set STPIN input pin to high voltage level.

Result:

Clock-gating is terminated. See figure below.

If SPI datagram transfers from microcontroller to TMC4330A prompt wakeup, do as follows:

Action:

- Set CLK_GATING_DELAY = 0xFFFFFFFF (register 0x14).
- Set CLK_GATING_REG = 0x0 (bit2:0 of register 0x4F).
- Set CLK_GATING_REG = 0x7 (bit2:0 of register 0x4F).
- Set clk_gating_en = 0 (bit17 of GENERAL_CONF register 0x00).

Result:

Clock-gating is terminated.

© 2015 TRINAMIC Motion Control GmbH & Co. KG, Hamburg, Germany — Terms of delivery and rights to technical change reserved. Download newest version at: www.trinamic.com .

13.6. Automatic Clock Gating Procedure

It is possible to use TMC4330A standby phase to automatically activate clock gating.

In order to activate automatic clock gating, do as follows:

Action:

- Set the time frame for STDBY_DELAY register 0x15 after ramp stop, and before standby phase starts.
- Set stdby_en = 1 (SCALE_CONF register 0x05).
- Set clk_gating_en = 1 (bit17 of GENERAL_CONF register 0x00).
- > Set proper *CLK_GATING_DELAY* register 0x14.
- Set clk_gating_stdby_en = 1 (bit17 of GENERAL_CONF register 0x00).

Result:

After standby phase activation, activation of clock gating counter follows. When the counter reaches 0, clock gating is activated.

In addition, the start signal generation, presented in chapter $\underline{9}$, page $\underline{64}$, can be used for an automated wake-up. An example is given in the figure below.

The chart below shows the TARGET_REACHED (=TR) signal, which signifies ramp stop at which *VACTUAL* reaches 0.

When VACTUAL = 0, the following process occurs:

- 1. The start delay timer signifies the time frame between ramp stop and next ramp start.
- 2. When the standby delay timer expires, the standby phase is activated.
- 3. When the standby phase is activated, the clock gating delay timer is started.
- 4. After the clock gating delay timer expires, clock gating is activated.
- 5. Shortly before the start delay timer expires, clock gating is disabled, which occurs so that the next ramp is started with proper assigned registers.

	4:3	VEL_STATE_F: Current velocity state: $0 \rightarrow VACTUAL = 0;$ $1 \rightarrow VACTUAL > 0;$ $2 \rightarrow VACTUAL < 0$								
	6:5	RAMP_STATE_F: Current ramp state: $0 \rightarrow AACTUAL = 0;$ $1 \rightarrow AACTUAL$ increases (acceleration); $2 \rightarrow AACTUAL$ decreases (deceleration)								
	7	STOPL_ACTIVE_F: Left stop switch is active.								
	8	STOPR_ACTIVE_F: Right stop switch is active.								
	9	VSTOPL_ACTIVE_F: Left virtual stop switch is active.								
	10	VSTOPR_ACTIVE_F: Right virtual stop switch is active.								
	11	Reserved.								
R	12	HOME_ERROR_F: HOME_REF input signal level is not equal to expected home level.								
	13	Reserved.								
	14	ENC_FAIL_F: Mismatch between XACTUAL and ENC_POS is out of tolerated range.								
	15	<i>N_ACTIVE_F</i> : N event is active.								
	16	ENC_LATCH_F: ENC_LATCH is rewritten.								
	17	Applies to absolute encoders only: <u>MULTI_CYCLE_FAIL_F</u> indicates a failure during last multi cycle data evaluation. Applies to absolute encoders only: <u>SER_ENC_VAR_F</u> indicates a failure during last serial data evaluation due to a substantial								
		deviation between two consecutive serial data values.								
	18	Reserved.								
	19	<i>CL_FIT_F</i> : Active if ENC_POS_DEV < CL_TOLERANCE. The current mismatch between XACTUAL and ENC_POS is within tolerated range.								
	23:20	Applies to absolute encoders only: <i>SERIAL_ENC_FLAGS</i> received from encoder. These flags are reset with a new encoder transfer request.								
	31:24	Reserved.

	Various Configuration Registers: Closed-loop, Switches							
R/W	Addr	Bit	Val Description					
	0x04	31:0	Reserved. Set to 0x00000000.					
			STP_LENGTH_ADD (Default: 0x0000)					
	0x10	15:0	U Additional length [# clock cycles] for active step polarity to indicate an active output step at STPOUT.					
		31:16	DIR_SETUP_TIME (Default: 0x0000)					
		51.10	U Delay [# clock cycles] between DIROUT and STPOUT voltage level changes.					
			START_OUT_ADD (Default:0x00000000)					
	0x11	31:0	U Additional length [# clock cycles] for active start signal. Active start signal length = 1+START_OUT_ADD					
			GEAR_RATIO (Default:0x01000000)					
	0x12	31:0	S Constant value that is added to the internal position counter by an active step at STPIN. Value representation: 8 digits and 24 decimal places.					
	0,12	31:0	START_DELAY (Default:0x0000000)					
RW	UX13		U Delay time [# clock cycles] between start trigger and internal start signal release.					
	0x14	31:0	CLK_GATING_DELAY (Default:0x0000000)					
			U Delay time [# clock cycles] between clock gating trigger and clock gating start.					
	0.15	31:0	STDBY_DELAY (Default:0x00000000)					
	0x15		U Delay time [# clock cycles] between ramp stop and activating standby phase.					
	0.17	23:0	PWM_VMAX (Default:0x00000000)					
	0x17		U PWM velocity value at which maximal scale parameter value 1.0 is reached.					
			HOME_SAFETY_MARGIN (Default: 0x0000)					
	0x1E	15:0	U HOME_REF polarity can be invalid within X _HOME \pm HOME_SAFETY_MARGIN, which is not flagged as error.					
	0x1F	15:0	PWM_FREQ (Default: 0x0280)					
	0711	15.0	U Number of clock cycles for one PWM period.					
	0x64	31:0	Reserved. Set to 0x00000000.					
		21.0	TZEROWAIT (Default:0x00000000)					
w	0x7B	31:0	U Standstill phase after reaching $VACTUAL = 0$.					
vv			CIRCULAR_DEC (Default:0x00000000)					
	0x7C	31:0	 Decimal places for circular motion if one revolution is not exactly mapped to an U even number of μSteps per revolution. Value representation: 1 digit and 31 decimal places.

14.13. Ramp Generator Registers

	Ramp Generator Registers							
R/W	Addr	Bit	Val	Description				
		RAM	PMOL	DE (Default:0x0)				
			Ope	ration Mode:				
		2	1	Positioning mode : <i>XTARGET</i> is superior target of velocity ramp.				
			0	Velocitiy mode : <i>VMAX</i> is superior target of velocity ramp.				
RW	0x20		Moti	on Profile:				
			0	No ramp: VACTUAL follows only VMAX (rectangle velocity shape).				
		1:0	1	Trapezoidal ramp (incl. sixPoint ramp): Consideration of acceleration and deceleration values for generating <i>VACTUAL</i> without adapting the acceleration values.				
			2	S-shaped ramp: Consideration of all ramp values (incl. bow values) for generating <i>VACTUAL</i> .				
	0.04	24.0	XA	CTUAL (Default: 0x00000000)				
RW	0x21	31:0	S	Actual internal motor position [pulses]: $-2^{31} \le XACTUAL \le 2^{31} - 1$				
			VA	CTUAL (Default: 0x00000000)				
R	0x22	31:0	S	Actual ramp generator velocity [pulses per second]: 1 pps $\leq VACTUAL \leq CLK_FREQ \cdot \frac{1}{2}$ pulses (f _{CLK} = 16 MHz \rightarrow 8 Mpps)				
		31:0	AA	CTUAL (Default: 0x0000000)				
R	0x23		S	Actual acceleration/deceleration value [pulses per sec ²]: $-2^{31} \text{ pps}^2 \le AACTUAL \le 2^{31} - 1$ 1 pps ² $\le AACTUAL $				
		31:0	VM	IAX (Default: 0x0000000)				
			31:0					Maximum ramp generator velocity in positioning mode or
RW	0x24			S	Target ramp generator velocity in velocity mode and no ramp motion profile.			
				Value representation: 23 digits and 8 decimal places ! Consider maximum values, represented in section 6.6.5, page 45				
			VS	TART (Default: 0x0000000)				
				Absolute start velocity in <i>positioning mode</i> and <i>velocity mode</i> In case <i>VSTART</i> is used: no first bow phase B ₁ for S-shaped ramps				
RW	0x25	30:0	U	VSTART in positioning mode:In case VACTUAL = 0 and XTARGET \neq XACTUAL:no acceleration phase for VACTUAL = 0 \rightarrow VSTART.				
			•	VSTART in velocity mode: In case VACTUAL = 0 and VACTUAL \neq VMAX: no acceleration phase for VACTUAL = 0 \rightarrow VSTART.				
				Value representation: 23 digits and 8 decimal places. Consider maximum values, represented in section <u>6.6.5</u> , page <u>45</u>

• MAIN MANUAL •

Ramp Generator Registers							
R/W	Addr	Bit	Val	Description			
			VS	TOP (Default:0x0000000)			
	0x26	30:0	U	Absolute stop velocity in positioning mode and velocity mode. In case <i>VSTOP</i> is used: no last bow phase B ₄ for S-shaped ramps. In case <i>VSTOP</i> is very small and positioning mode is used, it is possible that the ramp is finished with a constant <i>VACTUAL</i> = <i>VSTOP</i> until <i>XTARGET</i> is reached. <i>VSTOP</i> in positioning mode: In case <i>VACTUAL</i> ≤ <i>VSTOP</i> and <i>XTARGET</i> = <i>XACTUAL</i> : <i>VACTUAL</i> is immediately set to 0. <i>VSTOP</i> in velocity mode: In case <i>VACTUAL</i> ≤ <i>VSTOP</i> and <i>VMAX</i> = 0: <i>VACTUAL</i> is immediately set to 0. Value representation: 23 digits and 8 decimal places.			
			VB	! Consider maximum values, represented in section <u>6.6.5</u> , page <u>45</u> REAK (Default:0x00000000)			
	0x27	30:0	U	Absolute break velocity in positioning mode and in velocity mode, This only applies for trapezoidal ramp motion profiles. In case VBREAK = 0: pure linear ramps are generated with AMAX / DMAX only. In case VACTUAL < VBREAK: AACTUAL = ASTART or DFINAL			
RW		23:0	AM	AX (Default: 0x000000)			
	0x28		U	S-shaped ramp motion profile: Maximum acceleration value. Trapezoidal ramp motion profile: Acceleration value in case $ VACTUAL \ge VBREAK$ or in case $VBREAK = 0$. Value representation: Frequency mode: [pulses per sec ²] 22 digits and 2 decimal places: 250 mpps ² $\le AMAX \le 4$ Mpps ² Direct mode: [Δv per clk cycle] $a[\Delta v$ per clk_cycle] = $AMAX / 2^{37}$ $AMAX$ [pps ²] = $AMAX / 2^{37} \cdot f_{CLK^2}$! Consider maximum values, represented in section <u>6.6.5</u> , page <u>45</u>			
			DM	IAX (Default: 0x000000)			
	0x29	23:0	U	S-shaped ramp motion profile: Maximum deceleration value. Trapezoidal ramp motion profile: Deceleration value if $ VACTUAL \ge VBREAK$ or if $VBREAK = 0$. Value representation: Frequency mode: [pulses per sec ²] 22 digits and 2 decimal places: 250 mpps ² $\le DMAX \le 4$ Mpps ² Direct mode: [Δv per clk cycle] $d[\Delta v$ per clk_cycle] = $DMAX / 2^{37}$ $DMAX$ [pps ²] = $DMAX / 2^{37} \cdot f_{CLK^2}$! Consider maximum values, represented in section <u>6.6.5</u> , page <u>45</u>

	Ramp Generator Registers								
R/W	Addr	Bit	Val	Description					
			AS	TART (Default: 0x000000)					
				S-shaped ramp motion profile: start acceleration value.					
				Trapezoidal ramp motion profile: Acceleration value in case VACTUAL < VBREAK.					
		23:0		Acceleration value after switching from external to internal step control.					
	0x2A	23.0	U	Value representation: Frequency mode : [pulses per sec ²] 22 digits and 2 decimal places: 250 mpps ² $\leq ASTART \leq 4$ Mpps ² Direct mode : [Δv per clk cycle] a[Δv per clk_cycle]= $ASTART / 2^{37}$ $ASTART$ [pps ²] = $ASTART / 2^{37} \cdot f_{CLK}^2$! Consider maximum values, represented in section <u>6.6.5, page 45</u>					
		31		Sign of AACTUAL after switching from external to internal step control.					
			DF	INAL (Default: 0x000000)					
RW	0x2B	23:0	U	S-shaped ramp motion profile: Stop deceleration value, which is not used during positioning mode. Trapezoidal ramp motion profile: Deceleration value in case VACTUAL < VBREAK. Value representation: Frequency mode: [pulses per sec ²] 22 digits and 2 decimal places: 250 mpps ² \leq DFINAL \leq 4 Mpps ² Direct mode: [Δ v per clk cycle] d[Δ v per clk_cycle]= DFINAL / 2 ³⁷ DFINAL [pps ²] = DFINAL / 2 ³⁷ • f _{CLK²}					
		23		Consider maximum values, represented in section <u>6.6.5</u> , page <u>45</u> <i>TOP (Default: 0x000000)</i>					
	0x2C		U	Deceleration value for an automatic linear stop ramp to <i>VACTUAL</i> = 0. <i>DSTOP</i> is used with activated external stop switches (STOPL or STOPR) if <i>soft_stop_enable</i> is set to 1; or with activated virtual stop switches and <i>virt_stop_mode</i> is set to 2. Value representation: Frequency mode : [pulses per sec ²] 22 digits and 2 decimal places: 250 mpps ² \leq <i>DSTOP</i> \leq 4 Mpps ² Direct mode : [Δv per clk cycle] d[Δv per clk_cycle]= <i>DSTOP</i> / 2 ³⁷ <i>DSTOP</i> [pps ²] = <i>DSTOP</i> / 2 ³⁷ • f _{CLK} ² ! Consider maximum values, represented in section <u>6.6.5</u> , page <u>45</u>

	Ramp Generator Registers							
R/W	Addr	Bit	Val	Val Description				
			ВС	W1 (Default: 0x000000)				
	0x2D	23:0	U	Bow value 1 (first bow B ₁ of the acceleration ramp). Value representation: Frequency mode : [pulses per sec ³] 24 digits and 0 decimal places: 1 pps ³ $\leq BOW1 \leq 16$ Mpps ³ Direct mode : [Δa per clk cycle] bow[av per clk_cycle]= $BOW1 / 2^{53}$ $BOW1$ [pps ³] = $BOW1 / 2^{53} \circ f_{CLK}^3$! Consider maximum values, represented in section <u>6.6.5, page 45</u>				
			BC	W2 (Default: 0x000000)				
RW	0x2E	23:0	U	Bow value 2 (second bow B2 of the acceleration ramp). Value representation: Frequency mode : [pulses per sec ³] 24 digits and 0 decimal places: 1 pps ³ $\leq BOW2 \leq 16$ Mpps ³ Direct mode : [Δa per clk cycle] bow[av per clk_cycle]= $BOW2 / 2^{53}$ $BOW2$ [pps ³] = $BOW2 / 2^{53} \circ f_{CLK}^3$! Consider maximum values, represented in section <u>6.6.5</u> , page <u>45</u>				
			BC	W3 (Default: 0x000000)				
	0x2F	23:0	U	Bow value 3 (first bow B3 of the deceleration ramp). Value representation: Frequency mode : [pulses per sec ³] 24 digits and 0 decimal places: 1 pps ³ $\leq BOW3 \leq 16$ Mpps ³ Direct mode : [Δa per clk cycle] bow[av per clk_cycle]= $BOW3 / 2^{53}$ $BOW3$ [pps ³] = $BOW3 / 2^{53} \cdot f_{CLK^3}$! Consider maximum values, represented in section <u>6.6.5</u>, page <u>45</u>				
			ВС	W 4 (Default: 0x00000)				
	0x30	23:0	U	Bow value 4 (second bow B4 of the deceleration ramp). Value representation: Frequency mode: [pulses per sec ³] 24 digits and 0 decimal places: 1 pps ³ $\leq BOW4 \leq 16$ Mpps ³ Direct mode: [Δa per clk cycle] bow[av per clk_cycle]= $BOW4 / 2^{53}$ $BOW4$ [pps ³] = $BOW4 / 2^{53} \cdot f_{CLK}^3$! Consider maximum values, represented in section <u>6.6.5</u> , page <u>45</u>				

Table 62: Ramp Generator Registers

14.14. External Clock Frequency Register

	External Clock Frequency Register								
R/W	Addr	Bit	Val	Description					
RW	0x31	24.0	CLK_FR	EQ (Default: 0x0F42400)					
RW	0231	24.0	U	External clock frequency value f_{CLK} [Hz] with 4.2 MHz $\leq f_{CLK} \leq$ 30 MHz					

Table 63: External Clock Frequency Register

14.15. Target and Compare Registers

	Target and Compare Registers								
R/W	Addr	Bit	Val	Description					
RW	0x32	31:0	POS_CC	DMP (Default: 0x0000000)					
RVV	0x52	51.0	S	Compare position.					
RW	0x33	31:0	VIRT_S	TOP_LEFT (Default: 0x00000000)					
RVV	0222	51.0	S	Virtual left stop position.					
RW	0x34	21.0	VIRT_S	TOP_RIGHT (Default: 0x00000000)					
RW	0X34	31:0	S	Virtual right stop position.					
RW	0x35	31:0	X_HOM	E (Default: 0x0000000)					
RVV	0222		S	Actual home position.					
			X_LATC	<pre>H (Default: 0x0000000) (if circular_cnt_as_xlatch = 0)</pre>					
R		31:0 6	S	Storage position for certain triggers.					
ĸ			REV_CN	IT (Default: 0x0000000) (if circular_cnt_as_xlatch = 1)					
	0x36		S	Number of revolutions during circular motion.					
			X_RANC	GE (Default: 0x00000000)					
W		30:0	U	Limitation for X_ACTUAL during circular motion: $-X_RANGE \le X_ACTUAL \le X_RANGE - 1$					
			X_TARG	ET (Default: 0x0000000)					
RW	0x37	31:0	U	Target motor position in positioning mode. Set all other motion profile parameters before!					

Table 64: Target and Compare Registers

14.16. Pipeline Registers

	Pipeline Register									
R/W	Addr	Bit	Val	Description						
	0x38	31:0	S	X_PIPE0 (Default: 0x00000000): 1 st pipeline register.						
	0x39	31:0	S	X_PIPE1 (Default: 0x00000000): 2 nd pipeline register.						
	0x3A	31:0	S	X_PIPE2 (Default: 0x00000000): 3 rd pipeline register.						
RW	0x3B	31:0	S	X_PIPE3 (Default: 0x00000000): 4 th pipeline register.						
RW	0x3C	31:0	S	X_PIPE4 (Default: 0x00000000): 5 th pipeline register.						
	0x3D	31:0	S	X_PIPE5 (Default: 0x00000000): 6 th pipeline register.						
	0x3E	31:0	S	X_PIPE6 (Default: 0x00000000): 7 th pipeline register.						
	0x3F	31:0	S	X_PIPE7 (Default: 0x00000000): 8 th pipeline register.						

Table 65: Pipeline Register

14.17. Shadow Register

	Shadow Register								
R/W	Addr	Bit	Val	Description					
	0x40	31:0	S	SH_REG0 (Default: 0x00000000) : 1 st shadow register.					
	0x41	31:0	U	SH_REG1 (Default: 0x00000000) : 2 nd shadow register.					
	0x42	31:0	U	SH_REG2 (Default: 0x00000000) : 3 rd shadow register.					
	0x43	31:0	U	SH_REG3 (Default: 0x00000000) : 4 th shadow register.					
	0x44	31:0	U	SH_REG4 (Default: 0x00000000) : 5 th shadow register.					
	0x45	31:0	U	SH_REG5 (Default: 0x00000000) : 6 th shadow register.					
RW	0x46	31:0	U	SH_REG6 (Default: 0x00000000) : 7 th shadow register.					
r.vv	0x47	31:0	S/U	SH_REG7 (Default: 0x00000000) : 8 th shadow register.					
	0x48	31:0	U	SH_REG8 (Default: 0x00000000) : 9 th shadow register.					
	0x49	31:0	U	SH_REG9 (Default: 0x00000000) : 10 th shadow register.					
	0x4A	31:0	U	SH_REG10 (Default: 0x00000000) : 11 th shadow register.					
	0x4B	31:0	U	SH_REG11 (Default: 0x00000000) : 12 th shadow register.					
	0x4C	31:0	U	SH_REG12 (Default: 0x00000000) : 13 th shadow register.					
	0x4D	31:0	U	SH_REG13 (Default: 0x00000000) : 14 th shadow register.					

Table 66: Shadow Register

14.18. Reset and Clock Gating Register

	Reset and Clock Gating Register								
R/W	Addr	Bit	Val	Val Description					
			CLK_GAT.	ING_REG (Default: 0x0)					
	0x4F	2:0	0	Clock gating is not activated.					
			7	Clock gating is activated.					
RW			RESET_R	EG (Default: 0x000000)					
		31:8	0	No reset is activated.					
			0x525354	Internal reset is activated.					

Table 67: Reset and Clock Gating Register

15. Absolute Maximum Ratings

The maximum ratings may not be exceeded under any circumstances. Operating the circuit at or near more than one maximum rating at a time for extended periods shall be avoided by application design.

Maximum Ratings: 3.3V supply								
Parameter (VCC = 3.3V nominal \rightarrow TEST_MODE = 0V)	Symbol	Min	Max	Unit				
Supply voltage	Vcc	3.0	3.6	V				
Input voltage IO	V _{IN}	-0.3	3.6	V				

Table 73: Maximum Ratings: 3.3V supply

Maximum Ratings: 5.0V supply								
Parameter (VCC = 5V nominal \rightarrow TEST_MODE = 0V)	Symbol	Min	Max	Unit				
Supply voltage	V _{CC}	4.8	5.2	V				
Input voltage IO	VIN	-0.3	5.2	V				

Table 74: Maximum Ratings: 5.0V supply

Maximum Ratings: Temperature								
Parameter	Symbol	Min	Max	Unit				
Temperature	Т	-40	125	°C				

Table 75: Maximum Ratings: Temperature

16. Electrical Characteristics

DC characteristics contain the spread of values guaranteed within the specified supply voltage range unless otherwise specified. Typical values represent the average value of all parts measured at +25°C. Temperature variation also causes stray to some values. A device with typical values will not leave Min/Max range within the full temperature range.

DC Characteristics									
Parameter	Symbol	Conditions	Min	Тур	Max	Unit			
Extended temperature range	Тсом		-40°C		125	°C			
Nominal core voltage	V _{DD}			1.8		V			
Nominal IO voltage	V _{DD}			3.3 / 5.0		V			
Nominal input voltage	VIN		0.0		3.3 / 5.0	V			
Input voltage low level	VINL	$V_{DD} = 3.3V / 5V$	-0.3		0.8 / 1.2	V			
Input voltage high level	V _{INH}	$V_{DD} = 3.3V / 5V$	2.3 / 3.5		3.6 / 5.2	V			
Input with pull-down		$V_{IN} = V_{DD}$	5	30	110	μA			
Input with pull-up		$V_{IN} = 0V$	-110	-30	-5	μA			
Input low current		$V_{\rm IN} = 0V$	-10		10	μA			
Input high current		$V_{IN} = V_{DD}$	-10		10	μA			
Output voltage low level	VOUTL	$V_{DD} = 3.3V / 5V$			0.4	V			
Output voltage high level	V _{OUTH}	V _{DD} = 3.3V / 5V	2.64 / 4.0			V			
Output driver strength	Iout_drv	$V_{DD} = 3.3V / 5V$		4.0		mA			

Table 76: DC Characteristics

16.1. Power Dissipation

Power Dissipation						
Parameter	Symbol	Conditions	Min	Тур	Max	Unit
Static power dissipation	PDstat	All inputs at VDD or GND $V_{DD} = 3.3V / 5V$			1.1 / 1.7	mW
Dynamic power dissipation	PD _{DYN}	All inputs at VDD or GND f_{CLK} variable $V_{DD} = 3.3V / 5V$			2.7 / 4.0	mW / MHz
Total power dissipation	PD	$f_{CLK} = 16 \text{ MHz}$ V_DD = 3.3V / 5V			44.3 / 65.7	mW

Table 77: Power Dissipation

16.2. General IO Timing Parameters

General IO Timing Parameters						
Parameter	Symbol	Conditions	Min	Тур	Max	Unit
Operation frequency	fclk	$f_{CLK} = 1 / t_{CLK}$	4.2 ¹⁾	16	30	MHz
Clock Period	tclk	Rising edge to rising edge	33.5	62.5		ns
Clock time low			16.5			ns
Clock time high			16.5			ns
CLK input signal rise time	trise_in	20 % to 80 %			20	ns
CLK input signal fall time	t _{FALL_IN}	80 % to 20 %			20	ns
Output signal rise time	t rise_out	20 % to 80 % load 32 pF		3.5		ns
Output signal fall time	t fall_out	80 % to 20 % load 32 pF		3.5		ns
Setup time for SPI input signals in synchronous design	t _{su}	Relative to rising clk edge	5			ns
Hold time	t _{HD}	Relative to rising clk edge	5			ns

Table 78: General IO Timing Parameters

¹⁾ The lower limit for f_{CLK} refers to the limits of the internal unit conversion to physical units. The chip will also operate at lower frequencies.

16.5. Package Material Information

Please refer to the associated document "*TMC43xx Package Material Information, V1.00*" for information about available package dimensions and the various tray and reel package options. This document informs you about outside dimensions per tray and/reel and the number of ICs per tray/reel. It also provides information about available packaging units and their weight, as well as box dimension and weight details for outer packaging.

The document is available for download on the TMC4330A product page at <u>www.trinamic.com</u>.

i Should you require a custom-made component packaging solution or a different outer packaging solution, or have questions pertaining to the component packaging choice, please contact our customer service.

NOTE:

→ Our trays and reels are JEDEC-compliant.

16.6. Marking Details provided on Single Chip

The marking on each single chip shows:

Figure 67: Marking Details on Chip¹

APPENDICES

17. Supplemental Directives

ESD-DEVICE INSTRUCTIONS

	This product is an ESD-sensitive CMOS device. It is sensitive to electrostatic discharge.
	 Provide effective grounding to protect personnel and machines.
	Ensure work is performed in a nonstatic environment.
	Use personal ESD control footwear and ESD wrist straps, if necessary.
	Failure to do so can result in defects, damages and decreased reliability.
Producer Information	The producer of the product TMC4330A is TRINAMIC GmbH & Co. KG in Hamburg, Germany; hereafter referred to as TRINAMIC. TRINAMIC is the supplier; and in this function provides the product and the production documentation to its customers.
Copyright	TRINAMIC owns the content of this user manual in its entirety, including but not limited to pictures, logos, trademarks, and resources.
	© Copyright 2015 TRINAMIC®. All rights reserved. Electronically published by TRINAMIC®, Germany. All trademarks used are property of their respective owners.
	Redistributions of source or derived format (for example, Portable Document Format or Hypertext Markup Language) must retain the above copyright notice, and the complete Datasheet User Manual documentation of this product including associated Application Notes; and a reference to other available product-related documentation.
Trademark Designations and Symbols	Trademark designations and symbols used in this documentation indicate that a product or feature is owned and registered as trademark and,'or patent either by TRINAMIC or by ather manufacturers, whose products are used or referred to in combination With TRINAMIC's products and TRINAMIC's product documentation. This documentation is a noncommercial publication that seeks to provide concise scientific and technical user information to the target user. Thus, we only enter trademark designations and symbols in the Short Spec of the documentation that introduces the product at a quick glance. We also enter the trademark designation 'symbol when the product or feature name occurs for the first time in the document. All trademarks used are property of their respective owners.
Target User	The documentation provided here, is for programmers and engineers only, who are equipped with the necessary skills and have been trained to work with this type of product.
	The Target User knows how to responsibly make use of this product without causing harm to himself or others, and without causing damage to systems or devices, in which the user incorporates the product.
Disclaimer: Life Support Systems	TRINAMIC Motion Control GmbH & Co. KG does not authorize or warrant any of its products for use in life support systems, without the specific written consent of TRINAMIC Motion Control GmbH & Co. KG.
	Life support systems are equipment intended to support or sustain life, and whose failure to perform, when properly used in accordance with instructions provided, can be reasonably expected to result in personal injury or death.
	Information given in this document is believed to be accurate and reliable. However, no responsibility is assumed for the consequences of its use nor for any infringement

of patents or other rights of third parties which may result from its use. Specifications are subject to change without notice.

161/166

Disclaimer: Intended Use The data specified in this user manual is intended solely for the purpose of product description. No representations or warranties, either express or implied, of merchantability, fitness for a particular purpose or of any other nature are made hereunder with respect to information/specification or the products to which information refers and no guarantee with respect to compliance to the intended use is given.

In particular, this also applies to the stated possible applications or areas of applications of the product. TRINAMIC products are not designed for and must not be used in connection with any applications where the failure of such products would reasonably be expected to result in significant personal injury or death (Safety-Critical Applications) without TRINAMIC's specific written consent.

TRINAMIC products are not designed nor intended for use in military or aerospace applications or environments or in automotive applications unless specifically designated for such use by TRINAMIC. TRINAMIC conveys no patent, copyright, mask work right or other trade mark right to this product. TRINAMIC assumes no liability for any patent and/or other trade mark rights of a third party resulting from processing or handling of the product and/or any other use of the product.

Product
Documentation
DetailsThis document Datasheet User Manual contains the User Information for the
Target User.The Short Spec forms the preface of the document and is aimed at providing a
general product overview. The Main Manual contains detailed product information
pertaining to functions, and configuration settings. It contains all other pages of this
document.Collateral
