

Micropower Step-Up DC/DC Converter for PCMCIA Card Flash Memory

OBSOLETE:

FOR INFORMATION PURPOSES ONLY
 Contact Linear Technology for Potential Replacement

FEATURES

- 60mA Output Current at 12V from 3V Supply
- Shutdown to 10 μ A
- Programmable 12V or 5V Output
- Up to 85% Efficiency
- Quiescent Current: 750 μ A
- Low V_{CESAT} Switch: 300mV at 0.5A Typical
- Uses Low Value, Thin, Surface Mount Inductors
- Ultra-Thin 20-Lead TSSOP Package

APPLICATIONS

- PCMCIA Card Flash Memory VPP Generator
- Portable Computers
- Portable Instruments
- DC/DC Converter Module Replacements

DESCRIPTION

The LT[®]1106 is the industry's first DC/DC converter designed for use on Type I and Type II PCMCIA cards. The device senses the VPP1 and VPP2 lines at the PCMCIA socket and generates a regulated 12V, 60mA programming supply if the socket does not provide it. Internal logic simplifies the interface to PCMCIA card microcontrollers. One input selects a 12V or 5V regulated output, while another input controls micropower shutdown. Two logic outputs indicate when the selected programming voltage is valid and whether the input supply is 3.3V or 5V.

The regulator features Burst Mode[™] operation with a 0.5A, 300mV switch for efficiency up to 85%. High frequency 500kHz switching permits the use of small value, flat inductors that fit neatly on PCMCIA cards. The device requires just 1 μ F of output capacitance.

Quiescent current is 750 μ A which drops to 350 μ A when the card runs off the socket supply. The shutdown pin reduces supply current to only 10 μ A. The device includes a soft start feature which limits supply current transients when the card is inserted into a hot socket.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.
 Burst Mode is a trademark of Linear Technology Corporation.

TYPICAL APPLICATION

12V, 60mA Flash Memory Programming Supply

12V Output Efficiency

ABSOLUTE MAXIMUM RATINGS

V _{CC} Voltage	7V
V _{SW} Voltage	20V
AVPP Voltage	20V
VPP1, VPP2 Voltage	20V
G1, G2 Voltage	20V
V _{ON/OFF} Voltage	7V
V _{SEL} Voltage	7V
I _{LIM} Voltage	7V
Maximum Power Dissipation	500mW
Operating Temperature Range	0°C to 70°C
Storage Temperature Range	-65°C to 150°C
Lead Temperature (Soldering, 10 sec)	300°C

PIN FUNCTIONS

SELECT $\overline{12}/5$ (Pin 1): Tie to V_{IN} or logic 1 for 5V output; tie to GND or logic 0 for 12V output.

SOFT START (Pin 2): A 0.1 μ F/1M Ω parallel RC from this pin to GND provides a Soft Start function upon device turn-on. Initially about 80 μ A will flow from the pin into the capacitor. When the voltage at the pin reaches approximately 0.4V, current ceases flowing out of the pin. See Applications Information section.

V_{CC} (Pins 3, 4): Input Supply. Both pins should be tied together. At least 1 μ F input bypass capacitance is required. More capacitance reduces ringing on the supply line.

$\overline{3}/5$ (Pin 5): Supply Comparator Output. This pin provides logic output indicating the value of the input supply. High when $V_{CC} = 5V$; low when $V_{CC} = 3.3V$.

PGND (Pins 6, 7): Power Ground. Connect to ground plane.

V_{SW} (Pins 9, 10, 11): Collector of Power Switch. High dV/dt present on this pin. To minimize radiated noise keep layout short and direct.

GND (Pin 13): Signal Ground. Connect of ground plane.

VPP VALID (Pin 14): This pin provides a logic signal indicating that output voltage is greater than 11.4V. Active low with internal 200k pull-up resistor.

G1, G2 (Pins 16, 15): External MOSFET Gate Drives. When VPP1 or VPP2 is greater than 11.7V, G1 or G2 is driven to about 0.8V. When VPP1 or VPP2 is less than 11.7V, the drives assume a high impedance state pulled up to the AVPP pin through an internal 100k resistor.

VPP1, VPP2 (Pins 18, 17): Programming Power Inputs. The LT1106 senses both VPP1 and VPP2 supplies at the PCMCIA card socket. If VPP1 or VPP2 is greater than 11V, the LT1106 operates in “Doze” Mode—the switching regulator turns off and the drive to external P-channel MOSFETs turns on. Supply current in Doze Mode is about 350 μ A. Input current into VPP1 and VPP2 is about 1 μ A when the device is shut down.

AVPP (Pin 19): Output Sense Pin. This pin connects to a 1M Ω resistive divider that sets the output voltage. In shutdown, the resistor string is disconnected and current into this pin is reduced to <1 μ A.

ON/ \overline{OFF} (Pin 20): Shutdown Control. When pulled below 1.5V, this pin disables the LT1106 and reduces supply current to 10 μ A. All circuitry except the $\overline{3}/5$ comparator is disabled in shutdown. The part is enabled when ON/ \overline{OFF} is greater than 1.5V.

BLOCK DIAGRAM

APPLICATIONS INFORMATION

Functional Description

The LT1106 is a micropower, step-up DC/DC converter specifically configured for PCMCIA flash memory card VPP generation. The device generates a 5V or 12V output selectable via the $\overline{12/5}$ Select pin. If 12V is present on either the VPP1 or VPP2 pins, gate drive outputs G1 and G2 are driven low, turning on external PMOS devices. The switching regulator inside the LT1106 is idled when 12V is present on VPP1 or VPP2.

The $\overline{VPP\ VALID}$ output goes low when the voltage at AVPP exceeds 11.4V. This signal can be used to indicate presence of a valid programming voltage. The $\overline{3/5}$ comparator indicates whether the input voltage is 3.3V or 5V.

The Soft Start pin can be used to limit inrush current upon start-up. A 0.1 μ F capacitor in parallel with a 1M resistor is connected between this pin and ground to limit peak inductor current at start-up.

Switching Regulator Operation

When 12V is not present on the VPP1 or VPP2 pins and the device is enabled ($\overline{ON/OFF} = 1$), the LT1106 generates a regulated voltage at the AVPP pin. This voltage is programmable between 5V or 12V depending on the state of the $\overline{12/5}$ Select pin. Referring to the block diagram, hysteretic comparator C1 monitors AVPP via the resistor divider. When the negative input of C2 falls below 1.24V, C1's

APPLICATIONS INFORMATION

output goes high, enabling the oscillator. Switch Q1 alternately turns on causing current build-up in the inductor; then turns off allowing the built-up current to flow into the output capacitor via the catch diode. As the output voltage increases, so does the voltage at C1's negative input. When it exceeds the reference voltage plus C1's hysteresis, C1 turns the oscillator off.

Switch current is limited to approximately 600mA by Q2, R1 and C3. Two percent of Q1's collector current flows in Q2; this current flows through R1 causing a voltage drop in R1 proportional to Q1's collector current. When R1's drop equals 36mV, comparator C3 forces the oscillator off. This action results in varying on-time, fixed off-time operation that keeps peak switch current controlled. By connecting a 0.1 μ F capacitor from the Soft Start pin to ground, a current will flow in Q3 upon start-up. The current flows through 700 Ω resistor R2, reducing the amount of current needed from Q2 to force the oscillator off. As current flows into the 0.1 μ F capacitor, the voltage at pin 2 increases and eventually current ceases to flow in Q3.

Inductor Selection

All components for use in PCMCIA Type I cards must be less than 1.1mm high. This somewhat limits the selection of appropriate inductors. Dale Electronics (605-665-9301) manufactures the ILS-3825-01, a monolithic ferrite inductor that meets Type I height requirements. Generally, inductors used with the LT1106 must fulfill several requirements. It must be able to carry 0.95A (the maximum switch current) without saturation. DCR should be kept low to maintain efficiency. The switching frequency of the LT1106 is quite high, over 500kHz so magnetic material is important. Ferrite core material works well in this frequency range. Avoid low cost iron powder cores which

have substantial AC loss at the LT1106's switching frequency. Inductance value need not be over 10 μ H.

Capacitor Selection

The LT1106 will operate with 1 μ F of output capacitance. Output ripple voltage is approximately 400mV with this value and can be reduced significantly by increasing output capacitance. The ripple voltage, although on the high side, poses no problems for programming flash memory. If operating the device in 5V output mode the capacitance should be increased. Ceramic capacitors are suitable for the output. Distributed capacitance, i.e., 0.1 μ F or 0.2 μ F units next to individual flash memory chips, is acceptable. The input capacitor should have at least some tantalum capacitance (low Q) to minimize resonance on the input. Flash memory cards are typically several inches away from a solid low impedance supply due to sockets, connectors, etc. If just ceramic capacitors are used at the supply pin of the LT1106, switching currents will resonate the supply line causing ringing that can exceed 500mV_{P-P}. The high Q, low ESR nature of ceramic capacitors causes this. A few microfarad's worth of tantalum capacitors with moderate ESR and low Q characteristics will reduce or eliminate the problem.

Diode Selection

As with inductors, most good power Schottky diodes are in packages that exceed the 1.1mm height limit of the Type I PCMCIA card. Motorola manufactures the MBR0530 Schottky diode, ideal for use with the LT1106. This diode's maximum height however, is 1.35mm, making it difficult to use in Type 1 cards. Philips Components manufactures the BAT54C. Four units in parallel make an adequate diode.
