Single, Dual, Quad General **Purpose, Low Voltage Comparators**

The LMV331 is a CMOS single channel, general purpose, low voltage comparator. The LMV393 and LMV339 are dual and quad channel versions, respectively. The LMV331/393/339 are specified for 2.7 V to 5 V performance, have excellent input common-mode range, low quiescent current, and are available in several space saving packages.

The LMV331 is available in 5-pin SC-70 and TSOP-5 packages. The LMV393 is available in a 8-pin Micro8[™], SOIC-8, and a UDFN8 package, and the LMV339 is available in a SOIC-14 and a TSSOP-14 package.

The LMV331/393/339 are cost effective solutions for applications where space saving, low voltage operation, and low power are the primary specifications in circuit design for portable applications.

Features

- Guaranteed 2.7 V and 5 V Performance
- Input Common-mode Voltage Range Extends to Ground
- Open Drain Output for Wired-OR Applications
- Low Quiescent Current: 60 µA/channel TYP @ 5 V
- Low Saturation Voltage 200 mV TYP @ 5 V
- Propagation Delay 200 ns TYP @ 5 V
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications

- Battery Monitors
- Notebooks and PDA's
- General Purpose Portable Devices
- General Purpose Low Voltage Applications

Figure 2. Hysteresis Curve

MARKING DIAGRAMS

MAXIMUM RATINGS

Symbol	Rating	Value	Unit
V _S	Voltage on any Pin (referred to V ⁻ pin)	5.5	V
V _{IDR}	Input Differential Voltage Range	±Supply Voltage	V
TJ	Maximum Junction Temperature	150	°C
T _A	Operating Ambient Temperature Range LMV331, LMV393, LMV339 NCV331 (Note 3)	-40 to 85 -40 to 125	°C
T _{stg}	Storage Temperature Range	-65 to 150	°C
ΤL	Mounting Temperature (Infrared or Convection (1/16" From Case for 30 Seconds))	260	°C
V _{ESD}	ESD Tolerance (Note 1) Machine Model Human Body Model	100 1000	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Value	Unit
V _{CC}	Supply Voltage Temperature Range (Note 2)	2.7 to 5.0	V
θ _{JA}	Thermal Resistance SC-70 TSOP-5 Micro8 SOIC-8 UDFN8 SOIC-14 TSSOP-14	280 333 238 212 350 156 190	°C/W

I. Human Body Model, applicable std. MIL–STD–883, Method 3015.7. Machine Model, applicable std. JESD22–A115–A (ESD MM std. of JEDEC) Field–Induced Charge–Device Model, applicable std. JESD22–C101–C (ESD FICDM std. of JEDEC).
 2. The maximum power dissipation is a function of T_{J(MAX)}, θ_{JA}. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} – T_A)/_{θJA}. All numbers apply for packages soldered directly onto a PC board.
 3. NCV prefix is qualified for automotive usage.

2.7 V DC ELECTRICAL CHARACTERISTICS (All limits are guaranteed for $T_A = 25^{\circ}C$, V⁺ = 2.7 V, V⁻ = 0 V, V_{CM} = 1.35 V unless otherwise noted.)

Parameter	Symbol	Condition	Min	Тур	Max	Unit
Input Offset Voltage	V _{IO}			1.7	9	mV

APPLICATION CIRCUITS

Basic Comparator Operation

The basic operation of a comparator is to compare two input voltage signals, and produce a digital output signal by determining which input signal is higher. If the voltage on the non–inverting input is higher, then the internal output transistor is off and the output will be high. If the voltage on the inverting input is higher, then the output transistor will be on and the output will be low. The LMV331/393/339 has an open–drain output stage, so a pull–up resistor to a positive supply voltage is required for the output to switch properly.

The size of the pull–up resistor is recommended to be between 1 k Ω and 10 k Ω . This range of values will balance two key factors; i.e., power dissipation and drive capability for interface circuitry.

Figure 19 illustrates the basic operation of a comparator and assumes dual supplies. The comparator compares the input voltage (V_{IN}) on the non–inverting input to the reference voltage (V_{REF}) on the inverting input. If V_{IN} is less than V_{REF} , the output voltage (V_O) will be low. If V_{IN} is greater than V_{REF} , then V_O will be high.

Comparators and Stability

A common problem with comparators is oscillation due to their high gain. The basic comparator configuration in Figure 19 may oscillate if the differential voltage between the input pins is close to the device's offset voltage. This can happen if the input signal is moving slowly through the comparator's switching threshold or if unused channels are connected to the same potential for termination of unused channels. One way to eliminate output oscillations or 'chatter' is to include external hysteresis in the circuit design.

Inverting Configuration with Hysteresis

An inverting comparator with hysteresis is shown in Figure 20.

When V_{IN} is less than the voltage at the non-inverting node, V_+ , the output voltage will be high. When V_{IN} is greater than the voltage at V_+ , then the output will be low. The hysteresis band (Figure 21) created from the resistor network is defined as:

$$\Delta V_{+} = V_{T1} - V_{T2}$$

where V_{T1} and V_{T2} are the lower and upper trip points, respectively.

Figure 21.

 V_{T1} is calculated by assuming that the output of the comparator is pulled up to supply when high. The resistances R_1 and R_3 can be viewed as being in parallel which is in series with R_2 (Figure 22). Therefore V_{T1} is:

$$\mathsf{V}_{\mathsf{T1}} = \frac{\mathsf{V}_{\mathsf{CC}}\,\mathsf{R}_2}{\left(\mathsf{R}_1\,\|\,\mathsf{R}_3\right) + \,\mathsf{R}_2}$$

 V_{T2} is calculated by assuming that the output of the comparator is at ground potential when low. The resistances R_2 and R_3 can be viewed as being in parallel which is in series with R_1 (Figure 23). Therefore V_{T2} is:

$$\mathsf{V}_{\mathsf{T2}} = \frac{\mathsf{V}_{\mathsf{CC}} \big(\mathsf{R}_2 \, \| \, \mathsf{R}_3\big)}{\mathsf{R}_1 + \big(\mathsf{R}_2 \, \| \, \mathsf{R}_3\big)}$$

Figure 22.

Non–inverting Configuration with Hysteresis A non–inverting comparator is shown in Figure 24.

Figure 23.

Figure 24.

The hysteresis band (Figure 25) of the non–inverting configuration is defined as follows:

 $\Delta V_{in} = V_{CC}R_1/R_2$

Figure 25.

When V_{IN} is much less than the voltage at the inverting input (V_{REF}), then the output is low. R_2 can then be viewed as being connected to ground (Figure 26). To calculate the voltage required at V_{IN} to trip the comparator high, the following equation is used:

$$V_{in1} = \frac{V_{ref} \left(R_1 + R_2 \right)}{R_2}$$

When the output is high, V_{IN} must less than or equal to V_{REF} ($V_{IN} \le V_{REF}$) before the output will be low again (Figure 27). The following equation is used to calculate the voltage at V_{IN} to switch the output back to the low state:

Figure 26. Figure 27.

Termination of Unused Inputs

Proper termination of unused inputs is a good practice to keep the output from 'chattering.' For example, if one channel of a dual or quad package is not being used, then the inputs must be connected to a defined state. The recommended connections would be to tie one input to V_{CC} and the other input to ground.
